EMPLOYMENT AND LABOR FORCE IN MARYLAND

Trends and Projections, 1967-2005

January, 1986

Projection Series
Department of State Planning Publication 86-3
Price $15.00

FOREWORD

The employment projections that appear in this report update the Department of State Planning projections which appear in the publication entitled Employment in Maryland, Trends and Projections, 1967-2000, Publication 82-15, July 1982.

The report includes employment data on jobs by place of work for as many as fifty-two major industry groupings covering the historical period 1967-1983 and the projection years 1985, 1990, 1995, 2000, and 2005. Using the Standard Industrial Classification (SIC) system, historical and projected employment figures are displayed for each county and Baltimore City as well as for the seven State Planning regions and the State as a whole. The Standard Industrial Classification (SIC) system is used by Federal and State governments as well as many private organizations.

The projections were developed using an employment model with an economic base approach. The growth process within an area's economy is thought of as the interaction between basic activity sectors and non-basic (or dependent) activity sectors. The model assumes that local, basic activity sector employment is a function of total market demand for output. Non-basic sector growth is compared to overall growth in the basic sectors to form the relationship on which future growth is anticipated.

Since these projections are long-term, they refect primarily the results of the computer model. Even so, existing and anticipated economic conditions have influenced some of the assumptions used in setting the strategic parameters in the model, particularly in the short-term. In this way, growth and decline in employment in sectors and areas are adjusted to reflect current and anticipated trends in the economic environment.

Also included in this report are projections of the labor force for each jurisdiction. The labor force projections are based on the Department of State Planning's most recent population projections which appear in the publication entitled Projections for Maryland Subdivisions, Report 5, Development Planning Series-'85, Publication 85-28, October, 1985. The labor force projections are reconciled with the projections of employment (jobs by place of work) based on assumptions about unemployment, multiple jobholders, and net commutation.

The employment and labor force projections, as well as the other long range projections prepared by this Department, including population and housing projections, are part of a comprehensive data base developed and maintained for use in planning by this Department as well as other State agencies, local governments, and the general public. The projections are prepared to assist in carrying out one of the Department's two principal functions: to plan for the overall growth and development of the State, allocation of resources, and coordination of economic, environmental, and social goals.

The resulting projections are meant to be a guide for considering the future. While they may not reflect the future in its entirety with all of its uncertainties, they do provide a benchmark against which to ultimately compare what happens. They also provide a base from which plans for change can be considered, adopted, and even implemented.

DATA CONCEPTS AND SOURCES

I. Employment Data Concepts and Sources

Industry employment in this report represents the number of jobs in an industry estimated at the place of employment rather than the place of residence. Employment by place of work is not directly comparable to labor force, unemployment, and employment by place of residence statistics generated by such agencies as the Bureau of Labor Statistics and the Bureau of the Census. The conceptual step by step process necessary to make comparisons is:

Start: Total employment (jobs) by place of work
Minus: Military (active and reserve)
Equals: Total civilian jobs
Minus: Multiple job holders
Minus: In-commuters ⎫
Plus: Out-commuters ⎭ Net Commutation
Equals: Civilian employment by place of residence
Plus: Unemployment
Equals: Civilian labor force
Plus: Military (active duty)
Result: Total labor force

Comparisons between the employment measures are difficult because the statistics are not generally available to reconcile them. Information on "multiple job holders" is only available from occasional special studies. The only source for detailed commutation rates is journey-to-work statistics from the decennial censuses, although the Bureau of Economic Analysis has a set of unpublished estimates implicit in the "residence adjustment" used in their personal income statistics. Part-time jobs, except for multiple job holders and the military reserve (including most of the National Guard), are generally treated in the same way as full-time jobs in both statistics.

The employment model utilized in this study makes use of annual estimates of industry employment by place of work for the historical period 1967-1983. The estimates for each of the fifty-two employment sectors presented in the employment model are constructed by using the U.S. Department of Commerce, Bureau of Economic Analysis (BEA) data. BEA, as of April 1985, prepared unpublished employment estimates by 2-digit industry groups for all subdivisions for the period 1967 through 1983.* In preparing these estimates, BEA has primarily utilized the ES-202 reports of the State unemployment insurance programs (State UI covered employment).

Data sources utilized by BEA for the noncovered sectors include the decennial censuses, County Business Patterns data, the Censuses of Agriculture and the Censuses of Governments, and private trade and business organization statistics. The BEA wage and salary employment data based on the ES-202 reports are adjusted for undercoverage and the series includes aggregate estimates of self-employed persons. Farm and non-farm are estimated separately. Estimates of farm proprietors are constructed on the basis of information provided by the Censuses of Agriculture and U.S. Department of Agriculture data. Estimates of non-farm proprietors are constructed from data provided by the Internal Revenue Service and the Social Security Administration.

---

* See Appendix C for industry definitions.

The BEA industry employment figures represent the total number of jobs in an industry held not only by wage and salary workers but also by the self-employed. The Department of State Planning (DSP) utilizes these figures with appropriate adjustments to construct an historical industry employment series for Maryland for the period 1967-1983. To do this, estimates of the number of self-employed by industry sector are derived and adjusted for comparability with the 1967-1983 BEA series. In order to derive estimates of non-farm proprietors by industry, the BEA county totals for non-farm proprietors are broken out in the same industry detail for wage and salary employment. The disaggregation is achieved through the use of a self-employed to wage and salary worker ratio by industry compiled from the 1960 and 1970 censuses of population data on class of workers available for the State of Maryland and the Baltimore and Washington, D.C. SMSAs. Another source of information on self-employed and their distribution by industry sectors is the employment data from the BEA Regional and State employment projections prepared as part of the "OBERS" program.

Both sources of information on self-employed have shortcomings because they are not specific estimates for particular years and subdivisions (counties). While the proportion of self-employed to all employed is fairly stable over time, the proportions vary considerably among subdivisions, notably between urban versus rural counties. The ratios for all years are obtained by straight line interpolation between the benchmark years. The product of these ratios and BEA estimates of wage and salary employment by industry for the period 1967-1983 yield preliminary estimates of the self-employed by industry for each subdivision. These preliminary estimates are prorated so that the respective subdivision sum conforms to the BEA subdivision totals of non-farm proprietors. In the absence of subdivision level data on class of workers by industry comparable with the State and SMSA area information, the industry breakdown of non-farm proprietors in all non-SMSA counties is constructed by utilizing statewide ratios of the self-employed to wage and salary workers.

The conceptual difference between "number of jobs" for wage and salary workers and the "number of self-employed," who may also have more than one job, has always been a difficulty inherent in the BEA employment time series. Managerial workers, if not counted as salaried employees, may be executives (or consultants, proprietors or partners) in more than one company or enterprise. Various professionals, craftsmen, and salesmen may have more than one account, even though they do not maintain a base place of business. The reason for them being counted as one person-one job is the scarcity of information on self-employed including the absence of a meaningful definition of economic contents of a "job." With the April 1985 release by the Bureau of Economic Analysis' Regional Measurements Division of employment figures through 1983, the estimates for self-employed are based on a new concept, resulting in considerably higher numbers than in the past without adequate documentation of how the figures are estimated. This report is based on the old concept of self-employed for which consistent statistics are available back to 1967. The old concept of self-employed was also used by BEA's OBERS program in their recent release of State and Metropolitan Statistical Area projections (see Appendix B).

Some of the employment statistics for the historical years have been revised by BEA since our previous employment projections (August, 1982). The new data are reflected in this current revision.

The employment model utilized in this study also requires annual estimates of employment for the United States for the historical period 1967-1983 as well as projected national employment. The national employment data and projections for the fifty-two employment sectors used in the DSP projections were obtained from BEA for 1990, 1995, 2000, and 2005. The national figures for 1985 were estimated through interpolation based on the actual 1983 and projected 1990 figures. The national projections begin with GNP projections and include other economic variables such as national and regional population, personal income, earnings, spending and investments, and property transfers. The results of this national long-term projection model were obtained by DSP on magnetic tape. The BEA projections are also published by the Regional Economic Analysis Division in the 1985 OBERS BEA Regional Projections, Volume 1 - State Projections (see Appendix B-1) and Volume 2 - Metropolitan Statistical Area Projections (see Appendix B-2).

In addition to historical years 1967-1983, preliminary estimates of employment by industry for all jurisdictions were derived for 1984 and 1985, based primarily on first quarter UI employment data provided by the Maryland Department of Employment and Training. This was done so that the historical time series might better reflect the economic recovery from the recession reflected in the BEA figures for 1981, 1982, and 1983. While the first quarter estimates for 1984 and 1985 were not considered sufficiently complete or reliable to publish as historical figures for 1984 and 1985, they were used in the generation of all projections including those for 1985.

II. Labor Force Data Concepts and Sources

Labor force as used in this report is based on the Bureau of the Census concept from the 1970 and 1980 decennial censuses. The labor force consists of those persons 16 years old and over who are members of the Armed Forces or included in the civilian labor force. The civilian labor force includes both employed and unemployed persons. Labor force data relates to the place of residence and not to the place of work.

The labor force projections that appear in this report make use of the following data sources:

1. Actual 1970 and 1980 census figures and the Department's latest projections of population for 1985, 1990, 1995, 2000, and 2005 by sex and selected age cohorts (16-19, 20-24, 25-29, 30-34, 35-44, 45-54, 55-59, 60-64, 65+) for each jurisdiction of the State; and

2. Actual 1970 and 1980 census derived labor force (includes Armed Forces) participation rates for the above sex and age cohorts.

The Department's projections of labor force participation rates by sex and age for 1985, 1990, 1995, 2000, and 2005 are based on the observed county trend from 1970 to 1980 and national labor force participation rate trends as projected by the Bureau of Labor Statistics (Monthly Labor Digest, "The 1995 Labor Force: A Second Look." November, 1983). The labor force participation rate is simply the number of persons in a given sex and age cohort (e.g. females ages 20-24) who are in the labor force divided by the total population of persons who are in the same sex and age cohort.

The jurisdiction specific labor force projections are then reconciled with the Department's employment (jobs by place of work projections) based on the fact that the difference between total employed persons residing in a jurisdiction (the labor force less those persons unemployed) and the total employed persons working in the same jurisdiction (jobs by place of work less persons that are multiple jobholders) is equal to net commutation. Where net commutation is positive, the jurisdiction's supply of working people exceeds the demand for working people to fill jobs resulting in a net exit of workers from the jurisdiction to other jurisdictions for employment. Where net commutation is negative, the jurisdiction's demand for working people to fill jobs exceeds the available resident supply of working people resulting in a net entry of workers into the jurisdiction from other jurisdictions.

The reconciliation of the labor force and employment (jobs) by place of work projections uses 1970 and 1980 census data on employed persons by place of residence and their reported place of work. The resulting census estimates of employed persons by place of work are then reconciled with the BEA data (April 1983 release) on employment (jobs) by place of work. The difference between these two "place of work" statistics is attributed to multiple jobholders as well as statistical errors associated with the two data sources. The net commutation of workers for 1970 and 1980 is the difference between the census figures on employed persons by place of residence and the BEA derived figures on employed persons by place of work (BEA jobs less the "multiple jobholders").*

---

* For a more complete description of the derivation of net commutation estimates, the reader is referred to the Appendix A memorandum dated October 11, 1983, issued by the Office of Planning Data entitled "Analysis of Census Data on Commutation Patterns in Maryland, 1970 and 1980."

PROJECTION METHODOLOGY

I. Employment Projection Methodology

The employment model used in projecting future employment trends in subdivisions of the State utilizes an economic base approach. In this export base model, the growth process within an area's economy is visualized as an interaction between basic activity sectors and non-basic or dependent activity sectors. Basic activity sectors are classified as those primarily producing for export and non-basic activity sectors as those producing primarily for local demand. In the employment model, basic activity sectors include agriculture, mining, manufacturing, and the Federal government. The Federal government is classified as basic because its employment levels are largely influenced by federal expenditures over which local areas have little control. Non-basic activity sectors include the remaining sectors: construction, transportation, communication and public utilities, wholesale and retail trade, finance, insurance, and real estate, and services. (See Appendix C for industry definitions.)

A. Treatment of Employment Sectors

1. Basic Employment Sectors

The export base model analyzes trends in both inter- and intraindustry relationships and projects those relationships within the context of a national framework. Employment in basic activity sectors is related to an area's ability to compete with other areas for a portion of the total market share. Changes in a basic activity sector's share of employment can be perceived as a response to changes in total market factors external to the area. The employment model assumes that local area basic activity sector employment is a function of total market demand for output. Changes in these shares over time reflect gains or losses in the local area's competitive position vis-a-vis other areas.

2. Non-Basic Employment Sectors

Employment in non-basic or localized activity sectors is related primarily to the demand by local area households and businesses for goods and services. However, not all of this demand is local. Output in excess of local demand is exported and output below local demand is imported. It is, accordingly, necessary to divide non-basic employment into two separately determined components, export and residentiary. The residentiary component of a non-basic activity sector represents that part of sector employment which services local area households and businesses, and is functionally related to the growth generating activity sectors, specifically, basic as well as the export component of non-basic activity sectors.

To deal with the functional relationships in the model a step-down approach is utilized. Area employment in a basic activity sector is related to the historical and projected values of a corresponding activity sector within a broader area. For the State and its subdivisions employment in national activity sectors and employment in State activity sectors, respectively, are utilized as the exogeneous values. More specifically, State and county employment in each basic activity sector are expressed as a share of the basic activity sector for the nation and corresponding State respectively, and then extrapolated for future years based on the historical trend. The projected share is in turn multiplied by the projected employment for the nation or State to yield the absolute employment in the corresponding activity sector in the local area, specifically the State or county.

a. Export Component. The export component of non-basic employment in a local area is estimated for the historical period by use of an employment to population ratio in the analytical region. The export component in a local area is projected as follows: local area shares of analytical region employment are projected to determine future values. The resultant projected local area share is multiplied by the projected analytical region's employment to obtain projected local area employment. Employment in all basic industries and all export components of non-basic industries added together yield the export base or "growth generating employment" in the model.

b. Residentiary Component. Residentiary employment is projected by applying projected growth generating employment to projected multipliers. The interindustry relationship between residentiary and growth generating employment which is often called an "impact coefficient" or "export base multiplier" is estimated for the historical period and projected into the future.

Projected total employment in each non-basic activity sector is obtained by adding together the projected export and residentiary components.

B. Employment Projection Model Equations

The foregoing has described the general structure of the model. The system of equations describing the projection procedure is listed in the following section and is summarized in Figure 1.

1. Basic Employment Sectors

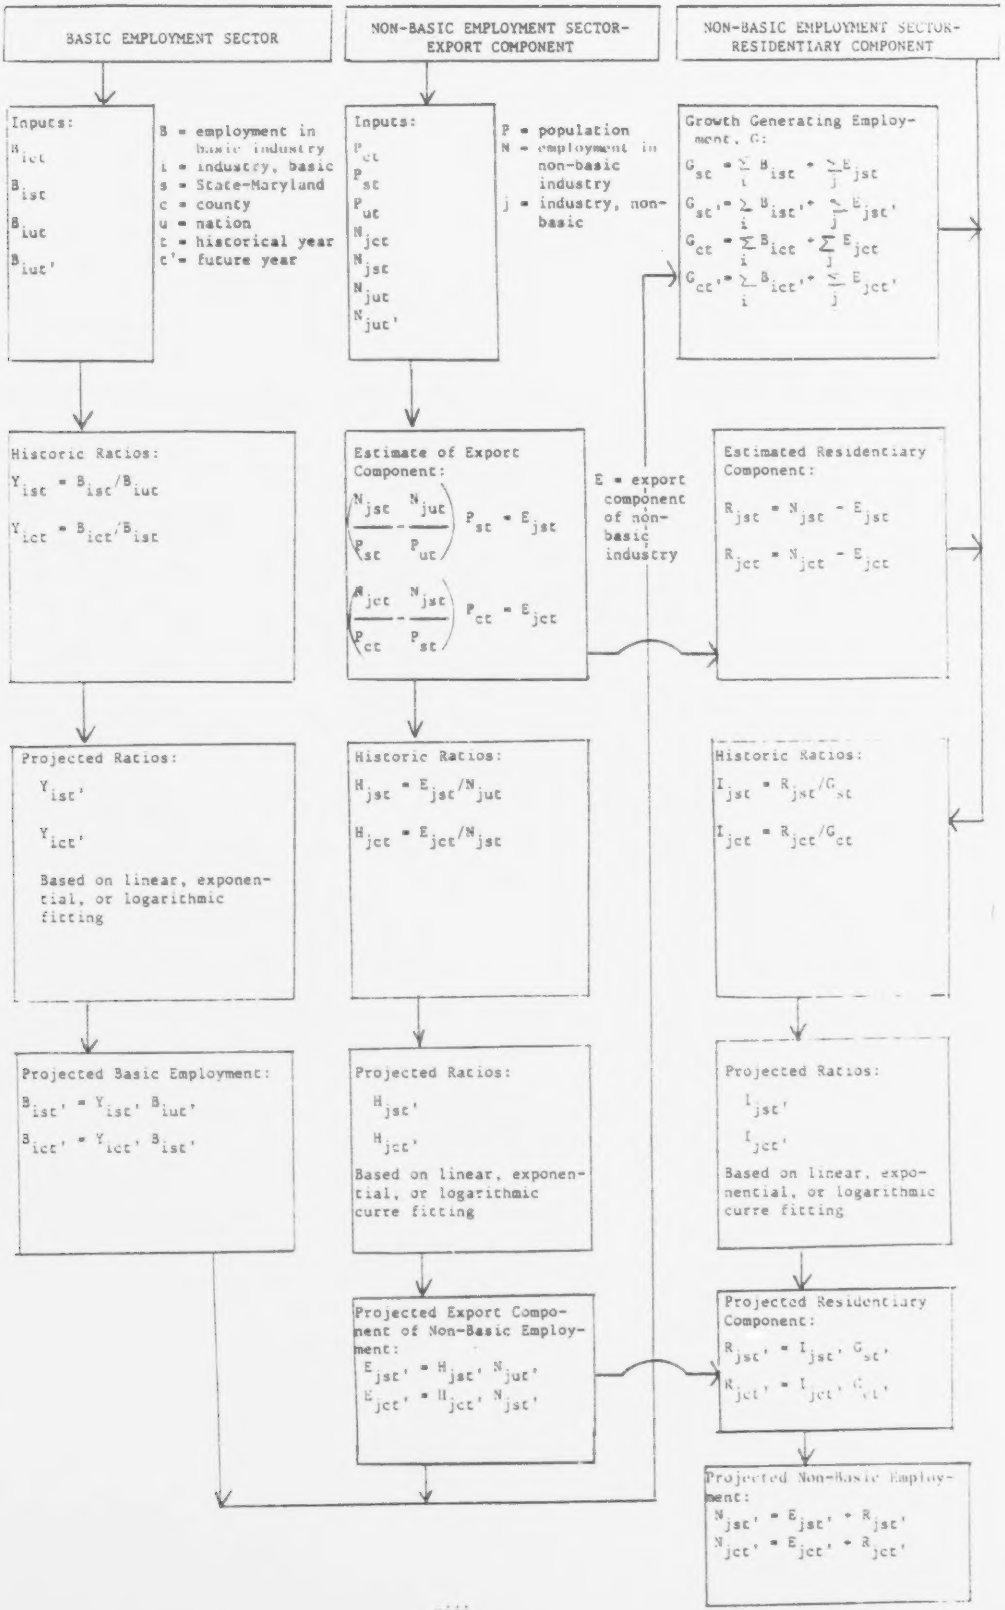
The historical series of State employment in each basic industry is first expressed as a share of the corresponding national emplcyment.

$$Y_{ist} = B_{ist} / B_{iut}$$

where:

Y = State share of total national employment.

FIGURE 1. EMPLOYMENT PROJECTION MODEL



BASIC EMPLOYMENT SECTOR
NON-BASIC EMPLOYMENT SECTOR-EXPORT COMPONENT
NON-BASIC EMPLOYMENT SECTOR-RESIDENTIARY COMPONENT
Inputs: B_{ict} B_{ist} B_{iut} $B_{iut'}$
B = employment in basic industry
i = industry, basic
s = State-Maryland
c = county
u = nation
t = historical year
t'= future year
Inputs: P_{ct} P_{st} P_{ut} N_{jct} N_{jst} N_{jut} $N_{jut'}$
P = population
N = employment in non-basic industry
j = industry, non-basic
Growth Generating Employment, G:
$G_{st} = \sum_i B_{ist} + \sum_j E_{jst}$
$G_{st'} = \sum_i B_{ist'} + \sum_j E_{jst'}$
$G_{ct} = \sum_i B_{ict} + \sum_j E_{jct}$
$G_{ct'} = \sum_i B_{ict'} + \sum_j E_{jct'}$
Historic Ratios:
$Y_{ist} = B_{ist}/B_{iut}$
$Y_{ict} = B_{ict}/B_{ist}$
Estimate of Export Component:
$\left(\frac{N_{jst}}{P_{st}} - \frac{N_{jut}}{P_{ut}}\right) P_{st} = E_{jst}$
$\left(\frac{N_{jct}}{P_{ct}} - \frac{N_{jst}}{P_{st}}\right) P_{ct} = E_{jct}$
E = export component of non-basic industry
Estimated Residentiary Component:
$R_{jst} = N_{jst} - E_{jst}$
$R_{jct} = N_{jct} - E_{jct}$
Projected Ratios:
$Y_{ist'}$
$Y_{ict'}$
Based on linear, exponential, or logarithmic fitting
Historic Ratios:
$H_{jst} = E_{jst}/N_{jut}$
$H_{jct} = E_{jct}/N_{jst}$
Historic Ratios:
$I_{jst} = R_{jst}/G_{st}$
$I_{jct} = R_{jct}/G_{ct}$
Projected Basic Employment:
$B_{ist'} = Y_{ist'}\ B_{iut'}$
$B_{ict'} = Y_{ict'}\ B_{ist'}$
Projected Ratios:
$H_{jst'}$
$H_{jct'}$
Based on linear, exponential, or logarithmic curre fitting
Projected Ratios:
$I_{jst'}$
$I_{jct'}$
Based on linear, exponential, or logarithmic curre fitting
Projected Export Component of Non-Basic Employment:
$E_{jst'} = H_{jst'}\ N_{jut'}$
$E_{jct'} = H_{jct'}\ N_{jst'}$
Projected Residentiary Component:
$R_{jst'} = I_{jst'}\ G_{st'}$
$R_{jct'} = I_{jct'}\ G_{ct'}$
Projected Non-Basic Employment:
$N_{jst'} = E_{jst'} + R_{jst'}$
$N_{jct'} = E_{jct'} + R_{jct'}$

B = employment in a basic industry.
i = subscript denoting basic industry i.
s = subscript denoting the State.
t = subscript denoting year t.
u = subscript denoting national total.

A least squares linear trend line is initially fitted to these State shares over time, and an extrapolation is made for the projection period.

$$Y_{ist} = a + bt$$

where:

a = the statistically derived constant.
b = the statistically derived coefficient for estimating Y over time.
t = year t.

A preliminary projection of State employment is then obtained by multiplying the projected State share times the projected national total.

$$B_{ist'} = Y_{ist'} \times B_{iut'}$$

where:

t' = some future year.

County projections are obtained in the same manner based on county percentages of the statewide total:

$$Y_{ict} = B_{ict} / B_{ist}$$

$$Y_{ict} = \alpha + \beta T$$

where c denotes county and α and β are the derived parameters in the county least squares regression equation.

In general, the least squares linear trend line produces acceptable projected figures only when the parameters b or β, the slope of the line, is positive and not too steep. For each declining industry (i.e., b or β less than zero), exponential regression lines are fitted of the type:

$$Y_{ist} = K_s + ab^x \text{ or } \mathrm{Ln}\, a + x\, \mathrm{Ln}\, b = \mathrm{Ln}\, (Y_{ist} - K_s)$$

and

$$Y_{ict} = K_c + \alpha\beta^x \text{ or } \mathrm{Ln}\,\alpha + x\mathrm{Ln}\,\beta = \mathrm{Ln}\, (Y_{ict} - K_c)$$

where:

K = horizontal asymptote for future years.

For all growing sectors where the linear parameters b or β are greater than one percent of the corresponding linear parameters a or α, modified logistic regression lines are fitted of the type:

$$Y_{ist} = \frac{K_s}{1 + e^{a+bx}} \quad \text{or} \quad a + bx = \mathrm{Ln}\,\frac{K_s - Y_{ist}}{Y_{ist}}$$

and

$$Y_{ict} = \frac{K_c}{1 + e^{\alpha+\beta x}} \quad \text{or} \quad \alpha + \beta x = \mathrm{Ln}\,\frac{K_c - Y_{ict}}{Y_{ict}}$$

where:

K = linear asymptote for future years

In all instances, the parameter K for the State or counties is defined in terms of the previously determined linear parameters a, b, α, and β.

2. Non-Basic Sectors

Total employment in each non-basic industry is divided into its export and residentiary components using the analytical area's ratio of total employment to total population.

$$\left(\frac{N_{jst}}{P_{st}} - \frac{N_{jut}}{P_{ut}}\right) * P_{st} = E_{jst}$$

$$\left(\frac{N_{jct}}{P_{ct}} - \frac{N_{jst}}{P_{st}}\right) * P_{ct} = E_{jct}$$

where:

N = employment in a non-basic industry.
j = subscript denoting non-basic industry.
E = export component of the non-basic industry.

a. Export Component. Following the procedure used for basic industries, the export component for each non-basic industry for the State and for each county is initially projected using a least squares linear trend line:

$$H_{jst} = E_{jst} / N_{jut}$$

$$H_{jst} = a + bt$$

$$E_{jst'} = H_{jst'} * N_{jut'}$$

and

$$H_{jct} = E_{jct} / N_{jst}$$

$$H_{jct} = \alpha + \beta t$$

$$E_{jct'} = H_{jct'} * N_{jst'}$$

where H is the export component of the area's non-basic industry employment, j is a subscript denoting the non-basic industry, and all other terms are defined as above.

As noted previously, the least squares liner trend line produces acceptable results only when the slope of the line is positive and not too steep. Therefore, exponential and modified logistics curve fitting is used for declining and growing sectors based on the same criteria described earlier.

b. Residentiary Component. The historic and projected employment in all basic industries and the export components of all non-basic industries are then summed to obtain State and county totals for historical and projected years:

$$G_{st} = \sum_i B_{ist} + \sum_j E_{jst}$$

$$G_{st'} = \sum_i B_{ist'} + \sum_j E_{jst'}$$

and

$$G_{ct} = \sum_i B_{ict} + \sum_j E_{jct}$$

$$G_{ct'} = \sum_i G_{ict'} + \sum_j E_{jct'}$$

where G is total growth generating employment.

The residentiary component for each non-basic industry is estimated as the difference between the non-basic industry total and the export component:

$$R_{jst} = N_{jst} - E_{jst}$$

and

$$R_{jct} = N_{jct} - E_{jct}$$

where R is the residentiary component.

The residentiary component of non-basic industries in the State and each county is then divided by the corresponding growth components. These ratios are then initially projected using the least squares technique with a linear trend line:

$$I_{jst} = R_{jst} / G_{st}$$

$$I_{jst} = a + bt$$

and

$$I_{jct} = R_{jct} / G_{ct}$$

$$I_{jct} = \alpha + \beta t$$

where I is the export base multiplier.

Once again, since the least squares linear trend line produces acceptable results only when the slope of the line is positive and not too steep, exponential and modified logistics curve fitting is used for declining and growing sectors, respectively, based on the same criteria described previously.

Projections of the residentiary component of non-basic industries are obtained by multiplying the projected multipliers times the projected growth components, for the State and counties, respectively:

$$R_{jst'} = I_{jst'} * G_{st'}$$

$$R_{jct'} = I_{jct'} * G_{ct'}$$

Projections of total employment in the non-basic industries are obtained by adding the projected export components and the projected residentiary components, for the State and for the counties, respectively:

$$N_{jst'} = E_{jst'} + R_{jst'}$$

$$N_{jct'} = E_{jct'} + R_{jct'}$$

The initial set of projections obtained using the model are evaluated in light of other economic attributes such as industrial structure, industrial productivity, current economic conditions (for 1985 projections only), specialization, and self-sufficiency. In a few instances, critical parameters are modified to result in a more reasonable set of projections for relevant activity sectors. The county level projections closely approximate the independently generated State level projections when summed over all counties. Because of this, the final State level projections that appear in this publication are the sum of the county projections.

II. Labor Force Projection Methodology and Reconciliation with Place of Work Employment

The labor force projections are based on the Department's most recent projections of population by sex and selected age cohorts (16-19, 20-24, 25-29, 30-34, 35-44, 45-54, 55-59, 60-64, 65+) for each jurisdiction of the State (see the publication entitled Projections for Maryland Subdivisions, Report 5, Development Planning Series - '85, Publication 85-28, October, 1985). The projections of the labor force are then reconciled with the place of work employment projections based on assumptions about unemployment, multiple jobholders, and net commutation.

A. Labor Force Projections

As used here, the labor force consists of that portion of the resident population that is either employed or unemployed and looking for work (civilian labor force) plus those persons in the armed forces.

Projections of the labor force by sex and age require, in addition to population projections, labor force participation rate projections by sex and age. The labor force participation rates are simply the number of persons in a given sex and age cohort (e.g. females 20-24) who are in the labor force divided by the total resident population of persons in the same sex and age cohort as of a given point in time.

The projected labor force participation rates by sex and age are derived based on actual trends from 1970 to 1980 in labor force participation rates by sex and age for each jurisdiction of the State based on decennial census data as well as national labor force participation rate trends projected by the Bureau of Labor Statistics (Monthly Labor Digest, "The 1995 Labor Force: A Second Look." November, 1983).

The equation used to generate the labor force projections by sex and age is:

$$LF_{ijk} = POP_{ijk} * LFPR_{ijk}$$

where:

i = sex
j = age cohort
k = year
LF = Labor Force
POP = Total Population
LFPR = Labor Force Participation Rate

The total labor force is then derived by summing over j (holding i constant) to derive the number of men and women in the labor force and then adding these two subtotals together to derive the total labor force figures, both actual (1970 and 1980 census) and projected (1985, 1990, 1995, 2000 and 2005).

B. Reconciliation of Labor Force Projections with Place of Work Employment Projections

Reconciling the total number of persons in the labor force in a given jurisdiction with the jurisdiction's total employment as measured in jobs requires assumption about unemployment, multiple jobholders, and net commutation. The reconciliation of labor force (resident employed and unemployed persons) and place of work employment (jobs) is expressed by the following equality:

$$\mathrm{LF}_k = \mathrm{POW}_k - \mathrm{MJ}_k + \mathrm{NETCOM}_k + \mathrm{UE}_k$$

where:

k = year

LF = Total Labor Force (includes persons in armed forces and civilian employed and unemployed persons as defined by the census)

POW = Place of Work Employment (jobs) based on BEA employment time series

MJ = Multiple Jobholders at Place of Work plus Statistical Discrepancy (this is an artifact derived by State Planning in the reconciliation of BEA place of work jobs with census derived place of work employed persons, see Appendix A memo dated October 11, 1983 - "Analysis of Census Data on Commutation Patterns in Maryland, 1970 and 1980").

NETCOM = Net Commutation (this is the difference between the number of employed persons living in the jurisdiction and the number of employed persons working in the jurisdiction; for 1970 and 1980 this was derived by State Planning based on its analysis of census commutation data, see Appendix A).

UE = Unemployed (this is the number of unemployed persons living in the jurisdiction)

Alternatively this equation can be expressed as:

$$(\mathrm{LF}_k - \mathrm{UE}_k) - (\mathrm{POW}_k - \mathrm{MJ}_k) = \mathrm{NETCOM}_k$$

where:

(LF-UE) = Employed persons in the labor force (place of residence)

(POW-MJ) = Employed persons working in the jurisdiction

NETCOM = The difference between (LF-UE) and (POW-MJ)

Based on the above equation, the following rates can also be defined:

$\frac{UE}{LF} * 100 =$ Unemployment Rate (Percent of labor force that is unemployed)

$\frac{MJ}{POW} * 100 =$ Multiple Jobholders Rate (Percent of place of work jobs held by the same person, also includes statistical error in reconciliation of BEA and census place of work employment)

$\frac{NETCOM}{POW-MJ} * 100 =$ Net Commutation Rate (net commuters as a percent of employed persons working in a jurisdiction)

For the two historical periods, 1970 and 1980, the labor force (LF) and unemployed (UE) come directly from the decennial census data while the place of work employment (POW) is from the U.S. Department of Commerce, the Bureau of Economic Analysis (April 1983 release). The multiple jobholders (MJ) and net commutation (NETCOM) figures for 1970 and 1980 are derived. Specifically, census commutation data on where people work was used to derive census based estimates on the numbers of persons working in Maryland's jurisdictions. This was then compared to BEA data on the number of jobs in the jurisdictions. The multiple jobholders (MJ) estimate is the adjusted discrepancy between these two figures.* The net commutation (NETCOM) is the difference between the census figures on employed persons in the labor force (LF-UF) and the derived estimate of employed persons working in the jurisdiction (POW-MJ).

In reconciling the labor force and employment (jobs) by place of work projections for the years 1985, 1990, 1995, 2000, and 2005 it is assumed that the multiple jobholder rate (as defined previously) remains constant throughout the projection period. The unemployment rate (see definitions above) for 1985 is assumed to be the census unemployment rate in 1980 multiplied by the change in the March unemployment rate for each jurisdiction from 1980 to 1985 as provided by the Department of Employment and Training in its monthly publication entitled Labor Market Indicators. For all future projection periods the unemployment rate is assumed to be the average of the 1980 and 1985 rates. The net commutation and commutation rates for each projection period are derived as residuals based on the formula shown above.

---

* For a complete description see the memo prepared by State Planning dated October 11, 1983 entitled "Analysis of Census Data on Commutation Patterns in Maryland, 1970 and 1980."

Based on the above assumptions, the linkage between the employment projections of jobs by place of work with the projected population for a jurisdiction is made via the labor force projections and the net commutation assumption. For a given projected jurisdiction population with age and sex components, the projected labor force participation rates are primarily the function of employment and economic opportunity. In addition, for a region, state, or jurisdiction the projected population and it's components are a function (through migration) of the same economic opportunity.

As stated above, our labor force participation rates were based on 1970-1980 trends as well as BLS projected national trends. Given our preliminary labor force projections and corresponding preliminary employment projections, our resulting net commutation assumption was assessed. Where the resulting labor force, employment, and net commutation projections did not appear consistant with 1970 to 1980 trends and recent experience, some adjustments were made.

SUMMARY OF LONG TERM PROJECTIONS

The objective of these projections is to identify and extrapolate long term trends. The impact of such factors as business cycles, recessions, labor disputes, energy crises, and changes in export-import policies, while reflected in the historical time series, are cancelled out in the long run. Anticipating such deviations in the future is outside the scope of this study. However, the impact of these factors on the historical time series and in particular the most recent years, inevitably affects the projected figures in the short term.

This report is an update of the projections published previously by DSP. As stated in the previous publication "...At the time of the current projections, June 1982, most analysts agree that the worst recession since the great depression of the 1930's is underway...what they do not agree on is whether the recovery is just around the corner or that the decline will continue..." and for how long. Now, three and a half years later, the recession is history. Even though the BEA employment figures for 1985 will not be reported until April, 1987, the newly projected Maryland employment figure of 2130.3 thousands for 1985 is almost 46,000 higher than that projected in June, 1982 during the depths of the recession. The newly projected figure for 1990 is 2265.5 thousands compared to our projection in 1978 of 2276.2 thousands and in 1982 of 2195.6 thousands.*

I. Trends and Projections in State Employment by Sector

Table 1 depicts the historical and projected trends in employment (jobs) by major industrial sectors for the State and the changing sector share of the State's employment.

Over the next twenty years, government's share of total employment is anticipated to continue to decrease with trade and services continuing to represent a larger share of total employment. Combined, government, trade, and services are projected to represent 72.2% of total employment in 2005 compared to 71.4% in 1983, 69.6% in 1980, and 64.4% in 1970. Most of the increase in the combined share represented by these three sectors will be compensated for by the continued decline in the share of total employment represented by manufacturing, a decline from 16.8% of total employment in 1970 to 10.2% in 1983 and a projected 9.1% in 2005. In general, the remaining major sectors are projected to maintain their share of total employment or to grow slightly. A closer examination of these trends by sector provides some insight into the changes that have occurred and may be anticipated to occur.

Agriculture in the historical period fluctuated considerably with a recent recovery from an earlier decline. For the future, little change from current levels is projected. When agricultural services, forestry, and fisheries are added to this sector, growth is projected because of the better performance in these latter sectors -- both historically and projected.

---

* The first set of employment projections of this type were published by the Department of State Planning in 1974 with projections through 1990.

Projections Prepared by Maryland Department of State Planning, Office of Planning Data (1985 Revisions)

Mining is not very strong in Maryland and, except for coal in Western Maryland, no major change is anticipated. As for coal, the growth experienced after the energy crunch in 1974-1975 has not been sustained. However, expansion is still anticipated (e.g., as a result of the planned opening of the major coal export route via the Port of Baltimore terminals).

Construction is a sector most influenced by business fluctuations and recessions as well as the levels of interest rates. Of its three sub-sectors (not independently projected), general and special trade contractors are more labor intensive and more influenced by economic downturns, thus, accounting for more fluctuations in employment than the third, heavy construction contractors. But, as a whole, the growth in this sector more closely reflects the general growth of the State economy and the relative wealth of the State. This, coupled with the continuation of growth in population in the prime age categories for household formation, continued strength in private non-residential construction, and growing public recognition of the need to maintain and replace an aging infrastructure account for the optimistic projection for the remainder of this century.

Employment among Maryland's manufacturers declined by almost twenty percent from the late 1960's to the mid-1970's. Economists and other observers and participants, both in public and private sectors, seemed for a while to unanimously predict doom and gloom based on the premise that the entire State economy must decline along with it. Yet, in the long run, except for a short period in 1941-1944 when manufacturing employment exceeded 350,000 and in 1966-1970 during the Vietnam escalation,* manufacturing jobs prior to 1980 remained at roughly the 240,000-250,000 range while the State population and employment have more than doubled. Even on the national level, employment in manufacturing has not kept pace with the overall growth in employment and has been stagnant for most of the past 15 years. The recession in the early 1980's impacted manufacturing most severely with a loss of over 40,000 jobs from 1980 to 1983. Some recovery has occurred by 1985 but the long run projections, while anticipating further recovery, do not show a return to 1980 levels.

A significant shift in trends and patterns among the manufacturing sectors may also be noted. The mature industries such as primary metals, steel, motor vehicles, and shipbuilding, which were the prime technology activities a decade or two ago, are either declining or stagnant. It is the present high technology industries, such as electronics, machinery, and instruments, which maintain the growth and vigor of the aggregate. Printing and publishing, which unlike the others is less oriented to the national markets, conspicuously shows the most growth. Also, the more labor intensive industries such as food and clothing show far less strength than the capital intensive high technology ones. For these reasons, the manufacturing projections show a general continuation of the overall stagnation in employment and a projected continued decline in manufacturing as a share of the State's overall employment.

---

* A 1972 study by the Department of State Planning, Defense Spending and Employment in Maryland, showed that the defense policies and changes in military procurements had a more than proportionate economic impact in this State.

The transportation, communications, and public utilities sector (T.C.P.U.) is halfway between the commodity producing and service sectors. Growth in this sector is primarily a consequence of Maryland's geographic location on the main North-South route of the Eastern Seaboard and the significance of the City of Baltimore as an international port. But it is not a homogeneous sector, encompassing such dissimilar activities as local transit, air transport, and nuclear power plants.

The trade sector combines both the wholesale and retail trades; the latter is, in itself, a combination of several detailed sectors (not independently projected). Both nationally and in this State, retail trade is one of the fastest growing employment sectors. Although it is strongly affected by both recession and inflation, in the long run it depends primarily on the affluence of the community and is projected accordingly. In addition, the continued increase in the population aged 25 to 44 (projected at over 22% between 1980 and 1990), as well as the larger number of women of child bearing age, should positively influence employment in retail trade. It is noteworthy that retail trade in our methodology had an export component, meaning that the State employment in this sector is more than proportionate to the nation, reflecting the aforementioned affluence. Conversely, wholesale trade did not have an export component despite the significance of the Port of Baltimore.

Finance, insurance, and real estate (F.I.R.E.) is also a sector with rapidly growing employment. Baltimore City is traditionally a major national finance center, even though to a lesser extent than such cities as New York and Philadelphia. Its institutions do, however, serve more than the State population and markets. It may be worth noting that among the four encompassed detailed sectors, only the real estate sector has an export component reflecting the suburban development of Washington, D.C. and, to a lesser extent, Baltimore. Even though the activities of these sectors are affected most directly by such factors as business cycles, inflation, and levels of interest rates, the employment in them seems to be more resilient and suffers less impact than might otherwise be expected.

Services are a heterogenous group of sectors, each projected separately and ranging from barbers, physicians and surgeons, and clergy to household workers and bill collectors. As a group, employment in services is growing very rapidly and is so projected, although some of the growth in the historical period may reflect only the expanded coverage, both in the national and local statistics. Employment in the services sector is very income elastic, more labor intensive, and less affected by productivity growth. It is also worth noting that employment in these sectors includes more than its share of lower paying and part-time jobs. Somewhat offsetting in this respect is that this sector includes most of the self-employed and highest paid professionals. The services sector has also absorbed much of the growth in the female labor force since 1970. With such diverse patterns and trends, it is believed that the logistics projection line (see the Projection Methodology for a more complete description) best reflects the growth trend for these sectors, a continuation of historical growth but with a declining growth rate in the long term. The only exception among the service sectors is household services (e.g., domestics) which has a declining long term trend. The logarithmic projection line (see Projection Methodology), with its continuous decline but decreasing rate of decline, is assumed in projecting this sector.

The public sectors - Federal, State, and local government and military employment - are projected differently from the private sectors. Although initially the Federal sector is treated as a basic industry and State and local government as residentiary, the final methodology is based on a different set of assumptions which also influence indirectly the projections for private sectors.

In the past in Maryland, the public sectors expanded at least as fast or faster than the economy as a whole. As a consequence, most of the long term projections - national, regional, state, and local - were high and subsequent revisions lower. In fact, for the past 10-15 years, national Federal civilian employment has hardly increased at all despite the tremendous expansion of the Federal role, budget, and programs. At the same time, military personnel declined. The current long term nationwide projections anticipate little growth in Federal employment. Federal employment in Maryland has historically grown faster than nationally and it is projected to grow slightly faster than the nation over this projection period. The military, responsive mostly to policy and "exogenous" variables, is held constant in the Maryland projections and is included in total employment primarily for completeness sake.

State and local government employment during the period 1967 to 1980 was growing faster in Maryland than in other states. In 1967 Maryland had 46.6 State and local government jobs per 1,000 population compared to 45.0 per 1,000 for the nation. By 1980 Maryland's rate per 1,000 population had increased to 69.8 compared to 58.4 for the nation. Since 1980, however, Maryland's State and local employment per 1,000 population has returned to a level more closely resembling that of the nation. It is assumed that this realignment has been largely completed and in these projections, the current ratio of State and local government employment to projected population is assumed for the projection period.

II. Trends and Projections in Employment and Labor Force by Region

Table 2 shows, by Department of State Planning Region, the share of total employment (jobs) for the historical years 1967, 1970, 1975, 1980, and 1983 and the projected years 1985, 1990, 1995, 2000, and 2005. Between 1967 and 1983 the highest shift in regional shares occurred in the Baltimore and Suburban Washington Regions. The rapid employment growth in the Suburban Washington Region has resulted in a change in share of the State's jobs from 22.1% in 1967 to 29.9% in 1983. At the same time, the Baltimore Region with its slower job growth declined in share from 60.5% to 54.9%. In the other regions of the State, job share has been increasing in the Southern Maryland Region, declining in the Western Maryland and Upper Eastern Shore Region and to a lesser extent the Lower Eastern Shore Region, and has remained largely unchanged in the Frederick Region.

In general, the projected regional shares reflect a continuation of these trends but with the rate of change diminishing over the long term. Job growth in the Washington area with its government base, its continued strong growth in the service sector, and high female labor force participation rates is expected to result in an increasing State share of jobs. The Batimore Region is expected to continue to experience a loss in State share of jobs but still above 50% even in the year 2005. The Southern Maryland share of jobs is expected to continue to increase slightly as employment increases in the residentiary sectors required to

TABLE 2. EMPLOYMENT (JOBS BY PLACE OF WORK) BY PLANNING REGION AND PERCENT OF STATE EMPLOYMENT, 1967-2005

Projections Prepared by Maryland Department of State Planning, Office of Planning Data (1985 Revisions) serve a growing population. In the Western Maryland Region, job share is expected to pick up slightly from the depressed early 1980's but will follow a slight downward trend over the long term. The Upper Eastern Shore Region is expected to continue its long term downward trend in its share of State jobs. In the Frederick and Lower Eastern Shore regions, the job share is expected to be fairly stable.

Table 3 provides an analysis of the relationship between employment (jobs by place of work) and the resident labor force (resident employed and unemployed persons) for the historical points in time, 1970 and 1980, and the projected points in time, 1990 and 2000. As described in the Projection Methodology, the difference between employed persons working in a region or jurisdiction (jobs less multiple jobholders) and employed persons living in a region or jurisdiction (labor force less unemployment) is net commutation. As used here, net commutation is positive where working persons living in a jurisdiction or region (the supply side) is greater than the number of persons required to fill the jobs that exist in the region (the demand side). Net commutation is negative where the "jobs" (demand side) exceed the available "workers" (supply side). The net commutation rate is defined as net commutation divided by the demand side or "jobs." A positive net commutation rate means net out-commuting from the jurisdiction or region. A negative net commutation rate means net in-commuting to the jurisdiction or region.

As shown in Table 3, Maryland, in both 1970 and 1980, experienced net out-commuting and this is projected to continue through the projection period with the net commutation rate consistent with the 1970 and 1980 experience. As shown, the labor force is projected to grow at a slightly faster pace than can be absorbed by employment opportunities in the State, with the excess supply absorbed by jobs out-of-state (principally by jobs in the non-Maryland portions of the Washington Metropolitan Area). In the Baltimore Region net out-commutation is expected to grow reflecting the fact that more employed residents are expected to be employed outside the region (principally in the Washington area including the Maryland portions of the Washington Metropolitan Area) in comparison to the number of persons outside the region who will be attracted to jobs in the region. In the Suburban Washington Region, net out-commuting is expected to decrease appreciably over the projection period as job growth in Montgomery and Prince George's County provides increased opportunities to the resident employed population as well as persons living outside the region. In the Southern Maryland and Frederick Regions, net out-commutation is expected to continue as the growing resident employed population continues to commute to job opportunities outside the region (particularly in the Washington Suburban and Metropolitan areas).

Western Maryland, in 1970 and 1980, was a net in-commuting region reflecting an excess in jobs over the capacity of the resident population to fill those jobs. Even though the region is projected to now begin to recover from the loss of jobs during the first half of the 1980's, the projections indicate that job growth may not keep pace with the labor force resulting in net out-commutation in the future. The Upper Eastern Shore as a region has been and is expected to continue to be a net out-commuting region as residents travel outside of the region to job

TABLE 3: RECONCILIATION OF EMPLOYMENT (JOBS) BY PLACE OF WORK WITH LABOR FORCE (RESIDENT PERSONS EMPLOYED AND UNEMPLOYED) - STATE AND PLANNING REGIONS - 1970, 1980, 1990, AND 2000.

Labor Force Participation Rate	59.7%	62.1%	64.0%	65.4%

opportunities in other portions of Maryland (principally Anne Arundel County) and outside the State (principally Delaware). In the Lower Eastern Shore Region, where until recently job growth has nearly kept pace with labor force growth, it is anticipated that net out-commutation is more likely in the future as job growth fails to keep pace with the labor force supply.

In summary, the employment (job) trends as projected shows a greater concentration of employment in the central Maryland portion of the State. Jobs in the central Maryland counties (Anne Arundel, Baltimore, Carroll, Harford, Howard, Montgomery and Prince George's) increased from 48.1% of all jobs in the State in 1967 to 60.7% in 1983 and are expected to reach nearly 65% by 2005. This concentration of employment in central Maryland and in what, for the most part, are the older suburban counties, is also influencing residential patterns. An increasing share of the State's labor force is in the newer suburban counties (specifically, Carroll, Harford, Howard, Frederick, Calvert, Charles, and Queen Anne's). These newer suburban counties had just 10.2% of the State's labor force in 1970. By 1980 these jurisdictions' share of the labor force had increased to 14.2% and by 2005 is expected to increase to 19.4%. The growth in suburban employment in central Maryland is making possible a shift in residential settlement to newer suburban areas. This is reflected in both the population growth in these newer suburban counties* and in changes in the commutation patterns as persons residing in these areas travel to the new employment opportunities in central Maryland.

AGENCY EMPLOYMENT PROJECTIONS

The purpose of this section is to provide information on the various projections of employment (jobs) by place of work that currently exist for Maryland and its jurisdiction. The intent is less to evaluate these projections relative to one another than it is to understand some of the reasons for the differences in the projections.

The projections reviewed in this section are those prepared by the U.S. Department of Commerce's Bureau of Economic Analysis (BEA), this Department (DSP), the Maryland Department of Employment and Training (DET), the Baltimore Regional Planning Council (RPC), and the Metropolitan Washington Council of Governments (COG). Table 4 summarizes the latest projections of employment (jobs) prepared by these agencies for the State of Maryland as well as geographic components of the State.

Differences in these projections are due to a number of factors including: differences in the underlying historical employment figures used in preparing the projections, differences in the projection methodologies and assumptions made in preparing the projections, and differences in when the projections were prepared and how events such as the 1982 recession and subsequent recovery were interpreted in determining the economic outlook (particularly in the short run).

The historical data used in the DSP and RPC projections are largely the same as the BEA data at the State amd regional levels, respectively. This is somewhat less true with respect to the COG historical figures which do not rely exclusively on BEA figures (particularly at the jurisdictional level). The DET figures represent only covered employment, basically wage and salary non-agricultural employment, which is only about 83% of all employment in Maryland. These differences as well as other differences are explored in more detail below for each of the agency projection series. At a minimum, any comparative assessment or evaluation of the agency projections should be based on an initial understanding of these differences.

I. Bureau of Economic Analysis (BEA) Projections

The U.S. Department of Commerce's BEA projections of State level employment (jobs) by place of work were developed in two phases. In the first phase, preliminary projections were developed using a mathematical model of economic growth. The model projects State growth in each industry based on projections of total employment in the industry and projections of the ratio of total employment in the industry in the State to the employment needed to meet intrastate demand for the industry's products.

In the second phase, the preliminary projections of employment in each industry were evaluated. For basic industries employment was evaluated based on the historical trend in the State's share of the nation's employment in that industry. This was done on the assumption that in the basic industries each State competes for a share of the national market for that industry. For non-basic, service related industries, State employment was evaluated based on

TABLE 4: ALTERNATIVE AGENCY PROJECTIONS OF EMPLOYMENT (JOBS) BY PLACE OF WORK FOR MARYLAND AND SUBSTATE GEOGRAPHIC AREAS

*BEA projections are available for the Baltimore MSA which includes the jurisdictions in the Baltimore Region plus Queen Anne's County. The BEA figures shown are the Baltimore MSA figures less an estimate for Queen Anne's County based on DSP projected figures. In 1983, Queen Anne's County's employment represented less than one percent of the Baltimore MSA's employment.

**BEA projections for the "Balance of State" are estimates based on the BEA State projections and the share of the DSP projections for the "Balance of State." The BEA projections for Suburban Washington Region are estimated by substracting from the BEA State projections, the BEA estimated projections for the Baltimore Region and Balance of State.

the ratio of the industry's share of total State employment to that industry's share of total national employment (i.e., the location quotient). For these industries it was assumed that each industry's employment is determined based on local demand which is dependent on the size of the overall economic base.* (See Appendix B.1.)

The resulting BEA projectons were made final after State government agencies (DSP in Maryland) participating in the Federal-State Cooperative Program for Population Projections (FSCPPP) had an opportunity to review and comment on them.

Using similar procedures BEA has recently released summary data on projections for Metropolitan Statistical Areas.** (See Appendix B.2.)

II. Maryland Department of State Planning (DSP) Projections

As noted in the section of this report on Data Concepts and Sources, the employment model used by DSP in preparing its projections uses the BEA historical time series 1967-1983. The BEA time series includes in addition to wage and salary employment (principally employment covered by the ES-202 reports of the State Employment Insurance Program), estimates for uncovered employment including farm and non-farm proprietors (self-employed).

The only change to the BEA State and jurisdiction time series made by DSP is to distribute the self-employed by industry. This contrasts, for example, to RPC which uses the BEA time series for regional controls but makes adjustments to the BEA figures in allocating employment to jurisdictions (see discussion that follows on RPC projections).

The DSP projection methodology is described fully in the preceding section on Project Methodology. Preliminary projections prepared using the mathematical model were reviewed by a number of jurisdictions in the Spring of 1985 as part of the regional and local population projection review process conducted by DSP. In November 1985, copies of the final projection revisions were sent to selected State agencies as well as all regional and county (includes Baltimore City) planning agencies. Two requests for modifications were made based on this dissemination, one by the Howard County Office of Planning and Zoning and one by the Washington Council of Governments on behalf of the Maryland-National Capital Park and Planning Commission for Prince George's County.

Howard County questioned the 1983 BEA figure on manufacturing employment (specifically, the electrical machinery sector), based on a comparison to local figures and those provided by the Maryland Department of Employment and Training for 1983, 1984, and 1985. After review and discussions with both Howard County and DET, it was decided to adjust the projections based on the higher employment figures from DET. The 1983 BEA figure was not changed however.

The Metropolitan Washington Council of Governments (COG) on behalf of Prince George's County requested that DSP's projections for Suburban Washington conform to those prepared through the COG cooperative forecasting process. DSP participates in the COG cooperative forecasting process and through this process has adopted the COG population forecasts for Montgomery and Prince George's counties. However, the COG baseline employment series (both for the region and jurisdictions) is not based exclusively on the BEA time series. As a result, it is more difficult for DSP to adopt or incorporate the COG jurisdictional level employment forecasts. Similar problems exist with jurisdictional forecasts of employment for the Baltimore Region prepared by RPC (see discussion on RPC forecasts that follows). However, based on the COG request, DSP's projections for Prince George's County were modified to more closely reflect the COG cooperative forecasts as well as the forecasts (both COG and DSP) for Montgomery County (see discussion on COG forecasts that follows).

III. Maryland Department of Employment and Training (DET) Projections

DET uses its labor market information to prepare projections of employment by industries and occupations. Unlike the other agency projections which were all updated sometime in 1985, the most recent published projections by DET were made several years ago using as their base 1982 figures.* As stated in the report on these projections, "...The recession of 1982 had considerably depressed employment levels throughout the State... If, in the coming months, Maryland's recovery is judged strong and long, it will no doubt be advisable to adjust industry growth upward. Until that certainty, however, a measure of caution is appropriate. The proper amount of caution is, we feel, reflected in the projections."

The DET employment projections are only for wage and salary employment covered by the Employment, Wages, and Contributions (ES-202) Program. While this data source is the principal source of BEA wage and salary employment data, the ES-202 program does not cover all employment. The ES-202 employment figures and the BEA figures are largely the same for the following sectors: manufacturing; transportation, communication, and public utilities; wholesale and retail trade; and finance, insurance, and real estate; and to a lesser extent, construction. The baseline data used by DET in its projections do not include farm and the agricultural services, forestry, and fisheries sector nor do they include non-wage and salary workers (proprietors including self employed). The DET figures also understate the combined BEA figures for services and government. As a result of the above, DET 1982 non-agricultural wage and salary employment represents only 83% of the employment as estimated by BEA (see Tabe 4) for 1982.

The ES-202 based projections were prepared by DET at the 2 digit SIC level for each jurisdiction in Maryland using one of several statistical models. The models incorporate national employment trends and projections in industry employment in conjunction with historical trends in industry employment in the jurisdiction. DET states that the resulting mechanical projections were reviewed with labor market analysts having knowledge of local industry employment. Where appropriate, adjustments were made based on economic factors and judgement.

In summary, the DET projections are not directly comparable to the BEA and DSP projections because of the differences in the employment coverage and projection techniques. In addition, the DET projections were made just as Maryland was beginning to recover from the economic recession and, therefore, do not reflect the more robust recovery which had taken place by the time the more recent projections by BEA, DSP, RPC, and COG were made.

---

* Maryland and Local Area Labor Market Analyses, Department of Employment and Training, Research and Analysis Division, 1983.

IV. Baltimore Regional Planning Council (RPC) Projections

RPC uses the BEA employment figures as regional controls for its projections of employment for the jurisdictions in the Baltimore Region: Anne Arundel, Baltimore, Carroll, Harford, and Howard counties and Baltimore City. RPC does not use the BEA jurisdictional figures. Instead, RPC uses its Master Establishment File (MEF) and other survey work to derive estimates of private and government employment by jurisdiction and small areas within each jurisdiction. The BEA jurisdictional figures are ignored by RPC based on their evidence that these figures (and, therefore, the DET ES-202 data) do not always reflect jobs by place of work. They contend that, under the ES-202 Program, multi-site firms with employment in more than one jurisdiction often report all employment as if it existed at the headquarters site alone.

The MEF was developed by RPC to attempt to correct for this reporting problem. The MEF represents about 90% of all businesses operating within the region. In creating the MEF, RPC starts with an establishment file from DET's ES-202 Program. Based on survey work RPC creates multiple establishment records for multi-site firms. Each record on the MEF then represents an establishment site with information on the address of the establishment, the number of employees, and geographic area identifiers such as county, census tract, regional planning district, and transportation planning zone. RPC believes that the estimates of jurisdiction employment they derive with the help of the MEF more accurately reflect place of work jobs than do either the BEA or DET figures.

In preparing the regional and jurisdictional forecasts, the RPC staff uses national and State employment projections as well as input from the local economic development and planning resource persons knowledgeable about new employment gains and expected employment losses. The employment projections also take into consideration other factors including the changing labor force -- the increasing numbers of women and younger workers and the resulting trend towards a higher ratio of jobs to population.* Table 5 summarizes the latest RPC employment projects for the region and jurisdictions through 1990. Updates to the most recent (Winter, 1984) long-range projections to the year 2010 are in the process of being prepared by RPC but were not available for inclusion in this report.

---

* For a more detailed explanation of the methodology involved see Employment Trends and Projections 1975-1985, Regional Planning Council, March 1982.

TABLE 5: BALTIMORE REGIONAL PLANNING COUNCIL
EMPLOYMENT TRENDS AND FORECASTS, BALTIMORE REGION -- 1980-1990
THOUSANDS OF FULL AND PART TIME JOBS BY PLACE OF WORK

V. Metropolitan Washington Council of Governments (COG) Projections

In preparing its regional, jurisdictional, and small area employment forecasts, COG and its member jurisdictions make use of a number of employment data sources including BEA, unemployment insurance files (ES-202 Program) for the Maryland, Virginia, and Washington, D.C. portions of the region, County Business Patterns, and their own establishment file. For these reasons the employment figures, particularly at the jurisdiction level, are not identical to the BEA figures.

Since 1976, COG has developed cooperative forecasts of population, housing, and employment for its member jurisdictions through the Cooperative Forecasting and Data Subcommittee. The third round of jurisdiction level projections was completed in June of 1983. More recently, the Round III intermediate-level forecasts were updated to more accurately reflect the post recession resurgence in employment, housing, and population not fully anticipated when Round III was completed.

In preparing the Round III forecasts, COG used the Federal employment projections prepared by the National Capital Planning Commission (NCPC) to derive alternative scenarios for federal civilian employment growth. These projections were used in conjunction with national projections of employment in twelve non-Federal economic sectors to derive alternative forecasts for the COG region. The national employment projections were obtained through 1990 from the U.S. Bureau of Labor Statistics and through 2010 based on BEA long-range forecasts. The Washington area forecasts were prepared using a regression model developed by NCPC. The model projects Washington area employment by sector as a function of national employment projections, federal employment projections for the region, and household and population assumptions. Based on three alternative scenarios of future growth, low, intermediate, and high employment forecasts were prepared for the region. Local jurisdictions then developed forecasts for their own jurisdictions using agreed upon guidelines and methodology. The sum of the jurisdiction forecasts were then reconciled with one another and with the regional total based on such considerations as comparison of growth rates, regional shares of total employment, and local methodologies and policy assumptions.*

Table 6 shows the intermediate term COG employment forecasts by jurisdiction. As noted above, they represent an update to the COG Round III, 1983 forecasts. Completed in September 1985 and approved by the COG Board on October 9, 1985, these forecasts are to remain in effect along with the low to high range forecasts approved in 1983 until development and approval of the next round of forecasts expected in 1987.

REPORT ORGANIZATION

I. Sections

The body of this report consists of five sections, containing historical and projected figures on employment (jobs) by place of work, labor force, and the reconciliation of employment (jobs) and labor force projections.

Section One: Summary of Employment by Geographic Area for the Major Sectors

This section provides summary data on employment (jobs) by place of work for the State, planning regions, and political subdivisions of the State. Separate summary report pages are provided for the following major employment sectors - total all sectors; agriculture, agricultural services, forestry and fishing; mining; construction; manufacturing - total, durable goods, and non-durable goods; transportation, communication and public utilities; trade; finance, insurance and real estate; services; and government. Accompanying the data on employment by sector and geographic area are figures which show each geographic area as a percent of total State employment for the sector. Historical data are provided for the years 1967, 1970, 1975, 1980, 1982, and 1983 and projections for 1985, 1990, 1995, 2000, and 2005.

Section Two: Summary of Employment by Major Sector for the State, Planning Regions, and Political Subdivisions

This section provides summary data on employment (jobs) by place of work by the major employment sectors (same as those listed above under Section I). A separate summary page is provided for the State, planning regions, and political subdivisions within the planning regions. For each jurisdiction, summary employment by major sector, average annual growth rate percentages, and each sectors share of total employment in the jurisdiction are provided. Historical data are provided for the years 1967, 1970, 1975, and 1980 and projected years 1985, 1990, 1995, 2000, and 2005.

Section Three: Detailed Employment by Major Sector for the State, Planning Regions, and Political Subdivisions

This section provides detailed data on employment (jobs) by place of work for 52 separate employment sectors based on the Standard Industrial Classification System. Separate reports are provided for the State, planning regions, and political subdivisions within the planning regions. Historical data are provided for the years 1967, 1970, 1975, 1980, 1982, and 1983 and projections for 1985, 1990, 1995, 2000, and 2005.

Section Four: Summary of Labor Force and Labor Force Participation Rates by Geographic Area

This section provides summary data on the labor force (includes armed forces and employed and unemployed persons residing in the jurisdiction) for the State, planning regions, and the political subdivisions of the State. Separate reports are provided for the total labor force, and male and female labor force. The annual average growth rate percentage, jurisdiction share of State labor force, and the percentage change in the size of the labor force are provided. Also shown on separate reports are total, male, and female labor force participation rates (the labor force as a percent of the population 16 years of age and over) for the State, planning regions, and political subdivisions of the State. The labor force data are provided for 1970 and 1980 based on the respective censuses and for the projected years 1985, 1990, 1995, 2000, and 2005.

Section Five: Detailed Labor Force by Age and Sex and Reconciliation of Population and Employment Projections for the State, Planning Regions, and Political Subdivisions

This section provides detailed data on the number of persons in the labor force and the labor force participation rates by sex and age. Separate reports are provided for the State, planning regions, and the political subdivisions of the State. The bottom half of the report provides a reconciliation between the population based labor force figures and the place of work employment (job) figures. This reconciliation is based on the balancing equation described in the Methodology Section which states that the difference between persons working in a jurisdiction (employment by place of work less multiple jobholders) and persons living in a jurisdiction who work (labor force less unemployed persons) is explained by net commutation. Historical data based on census labor force, unemployment, and commutation data and Bureau of Economic Analysis employment (jobs) data are provided for 1970 and 1980 and projected for 1985, 1990, 1995, 2000, and 2005.

II. Appendices

The report contains three appendices:

Appendix A. Memorandum dated October 11, 1983 on the Analysis of Census Data on Commuting Patterns in Maryland, 1970 and 1980

This appendix explains the methodological approach and results of the Department of State Planning's Office of Planning Data's analysis of commuting patterns based on the 1970 and 1980 censuses.

Appendix B. BEA Regional Economic Projections for the State and Metropolitan Areas

Includes summary information on the most recent projections of employment (jobs) for the State and metropolitan areas prepared by the Regional Economic Division, Bureau of Economic Analysis, United States Department of Commerce.

Appendix C. Industry Definitions

Includes definitions of the two digit Standard Industrial Classification (SIC) categories used in the OBERS projections prepared by the Bureau of Economic Analysis.

MEMORANDUM

TO: County and Regional Planning Directors

FROM: Michel A. Lettre, Director, Office of Planning Data

DATE: October 11, 1983

SUBJECT: Analysis of Census Data on Commuting Patterns in Maryland, 1970 and 1980

The enclosed materials summarize preliminary work conducted by DSP staff on the analysis and comparison of interjurisdictional commuting patterns for Maryland based on data from both the 1970 and 1980 censuses.

The DSP staff is endeavoring to develop a consistent Statewide base of information on commuting patterns as a general aid to State, regional, and county planning and as a data base to support our efforts as well as those of regional and local planning agencies to develop population and employment projections built upon a solid historical data base and reasonable scenarios of future trends.

Your close review of the enclosed tables and accompanying description of how each table is derived is of assistance to us in this effort.

Specifically, we would appreciate your review and comments directed to the following questions:

1. Does the Census data as displayed in Table 1 for 1970 and 1980 for your jurisdiction(s) appear generally reasonable?
2. Do the adjustments to the Census data made by DSP staff in Table 2 for 1970 and 1980 appear reasonable?
3. Comparing the results for your jurisdiction(s) as they appear in tables 4 and 5, which commuting patterns appear to better reflect the trend from 1970 to 1980?*

We would greatly appreciate feedback from you on the original data and methodological approach taken by us to adjust the data. Your remarks can be as simple as comments on xerox copies of the tables. Naturally, any large discrepancies would require a more detailed explanation with supporting evidence of the discrepancy and how you feel it could more appropriately be adjusted. We would like to receive your review and comments by November 10, 1983.

*Not included with Appendix A materials but available through the Department of State Planning's Office of Planning Data.

TELEPHONE: 301-383-5664
OFFICE OF STATE PLANNING DATA

We intend to publish the results of this analysis and to make them generally available to both public and private sector users. Your comments may form the basis for further adjustments to the tables. At a minimum, all significant comments from you will be noted and included in full or in summary form in the final publication so that users of the data will be aware of local and regional concerns about its completeness and accuracy.

If you have any questions about the tables and how the figures were derived, please call me or Milan Davinic, 301-383-5664. Also, please note in Tables 2-5 round off errors may cause numbers (including totals) to be slightly different within and across tables (typically the differences due to round off are very small and inconsequential in terms of a review of data).

Thank you for your cooperation and assistance.

Enclosures

TABLE 1A - 1980 Census Place of Work by Place of Residence, Workers 16 Years and Over

TABLE 1B - 1970 Census Place of Work by Place of Residence, Workers 14 Years and Over

Data on place of work by place of residence based on the sample questionnaire tabulations on journey to work from the 1980 and 1970 censuses are displayed in Table 1 for Maryland and its political jurisdictions. Each column of the three page matrix indicates the distribution of total resident employed persons by place of work. There are twenty-five columns on the first two pages, one for each county, Baltimore City, and a total for the State. The third page shows for neighboring states the employed residents that work in Maryland and the county in Maryland in which they work. The last column on page three is a first approximation of employed persons by place of work for the jurisdiction indicated by the given row (i.e., the sum of the row figures across pages 1-3 for a given jurisdiction).

The data in this table are subject to two types of error: (1) sampling error and (2) nonsampling error. Sampling error is due to the fact that the place of work data by place of residence is based on census questions asked of only a sample of persons and not the complete count of persons. Nonsampling errors are also present and are the result of errors that may be introduced in collecting and processing the data including the operations of editing, reviewing, and handling the questionnaires. Included in this are errors associated with respondents giving incorrect or incomplete information which is subsequently processed incorrectly.

For the above reasons, there is error associated with the matrix values and thus with the preliminary estimate of employed persons by place of work (last column page 3) derived by summing over the row values for a given jurisdiction. These row totals also tend to be somewhat understated since there are a significant number of "not reported" responses (second to last row) as well as responses that are only classified by all or portions of an SMSA and not specifically by jurisdictions (see "Remainder of SMSA's" portion of row totals). Finally, the column totals also slightly underrepresent total employment by place of residence as provided in other census publications.

TABLE 2A- 1980 Census of Work by Place of Residence, Workers 16+ Years and Over

TABLE 2B- 1970 Census of Work by Place of Residence, Workers 14+ Years and Over

Table 2 represents a first set of adjustments performed by DSP staff to the Table 1 matrix of values. These adjustments represent an effort to overcome some of the problems associated with the underestimation of county place of work employed persons as discussed in the last paragraph of the discussion on Table 1. These adjustments do not in any significant way affect the errors in the data associated with the sampling and nonsampling errors (see discussion re Table 1).

Specifically, the following adjustments to the Table 1 data are made in Table 2:

Step 1. "Remainder of SMSA's" are distributed to constituent jurisdictions based on "reasonable" proportions provided by existing allocations based on state, jurisdiction, or adjacent jurisdiction data.

Step 2. "Not Reported" are distributed across jurisdictions based on jurisdiction proportions created after distributing "Remainder of SMSA's."

Step 3. "Worked Elsewhere," mostly travelers and temporary assignments out of state or abroad, are treated like an "other states" category and not distributed.

Step 4. Undercoverage, the difference between this census tabulation of employed persons by place of residence and the census total employed persons by place of residence (including the military) from other census tabulations, is distributed to the jurisdictions across the board, based on the jurisdiction proportions (column percents) established after making the adjustments under steps 1-3.

Pages 1-3 of Table 2 look essentially the same as pages 1-3 of Table 1 except for the last column which is an adjusted total based on the distributions achieved as a result of steps 1-4 above. Page 4 of Table 2 gives a summary of the adjustments, the difference between the "Total Unadjusted" (from page 3, Table 1), and the "Total Adjusted" (from page 3, Table 2). Also provided is the "Net Commutation," the difference between the total place of work employment for a given jurisdiction (row total, "Total Adjusted," page 3) and the total place of residence employment for the same jurisdiction (column total, "Total").* The "Rate" is calculated by dividing the net commutation by the place of work employment (row total, "Total Adjusted," page 3).

---

* Net commutation as defined here is the converse of the definition used elsewhere in this report. As a result, what appears as negative net commutation or a negative net commutation rate is shown as a positive number in Section five of this report and vice versa. The difference is purely semantic.

The next column, "BEA 1980" or "BEA 1970," is the number of jobs by place of work (full and part-time) for each jurisdiction as compiled by the U.S. Department of Commerce's Bureau of Economic Analysis (BEA).* The difference between the BEA and the "total adjusted" column (census place of work) is labeled "Multiple Job Holders and Statistical Discrepancy." The figures under this column are generally positive since multiple job holders (double-counting from a census standpoint since census is employed persons not number of jobs) should be a significant part of any discrepancy between the two data sets. However, the differences are unequal and even unproportional among jurisdictions and in some cases even negative. This clearly reflects "statistical discrepancies" as the result of sample and/or nonsample errors in either or both the BEA and census data sets.

Even though both the BEA and Census are similar measures of "place of work employment" there are differences between them which may account for some of this discrepancy:

1. Measurement Period - Census reflects the status (respondents' answers) for the second week of April when the census is taken, while BEA estimates are based on 12 monthly reports that are averaged for the year. Notice, for instance, the large discrepancy for Worcester County, where jobs (tourism) are scarce in April, way below the average for the year.

2. Coverage - Census is based on a sample, which implies some sampling error, while BEA statistics are based on employers' reports mandated by "State unemployment insurance law," i.e., essentially full coverage. Yet BEA has to supplement this coverage by estimates for self-employed (on the basis of income tax, social security, and other "administrative records") and make adjustments for "delinquent reporting units" and employers who fail to report on time or not at all.

3. Data Quality - Census data reflects a subjective bias," i.e., the respondents' uncertainty about the proper answer as to the actual place of work. Notice the overstated census figure for Baltimore County in 1970, perhaps the result of too many answers to the question "County of Work" as simply - Baltimore rather than either City or County. On the other hand, BEA may be tabulating many jobs in Baltimore City, just because the employer's headquarters is located there regardless of where the actual work places are, despite all the BEA efforts to overcome and correct this bias.

In conclusion, the two sets of data with all adjustments and refinements still contain errors and uncertainties. Despite this, they remain almost the only available and reliable sources of complete data on place of work employment and commuting patterns.

---

* The employment figures shown are based on the April, 1983 BEA release.

TABLE 3A- 1980 Census Place of Work by Place of Residence, Workers 16 Years and Over

TABLE 3B- 1970 Census Place of Work by Place of Residence, Workers 14 Years and Over

The DSP staff in an effort to reconcile the differences between the census data and BEA data made use of a technique called "balancing the matrix." Basically it was assumed that both the Census and BEA data were partially in error and that some adjustment that would "split" the discrepancies somewhere in the middle would be an improvement.

Implicit in Table 2 is a matrix, 24 rows by 30 columns,* with one additional "Total" row and two summary columns (page 4) one for "Total Adjusted" census place of work employment (employed persons) and one for BEA place of work employment (jobs - part and full time). The technique of squaring the matrix makes use of the 24 x 30 matrix along with the row and column totals. The objective in this case is to make the Census and BEA column totals more consistent with one another.**

To accomplish this, first, each row is multiplied (scaled) by the ratio of the BEA to Census total for the corresponding row. This makes all the elements in each row perfectly consistent with the BEA statistics, so much so that they are now inconsistent with Census (column) control totals of employment by place of residence. Next, all the columns are multiplied (scaled) by ratios of the old to the new Census column totals, which makes the elements inside the matrix again consistent with the Census figures by place of residence but inconsistent with BEA figures by place of work - only less so than they were before.

Repeating these consecutive steps a number of times, say 7 or 25 iterations, would balance the matrix columns perfectly, making the last column of page 4, Table 2, uniform and equal to the State percentage (bottom of the column) implying that the percentage is exactly equal to the number of multiple job holders with no other discrepancy among the jurisdictions. But that would imply an overwhelming confidence in BEA statistics as against the Census. Since the idea is to split the discrepancies somewhere in the middle between the two sets of statistics it was decided after some trial and error processing to tabulate the results after 3 iterations for 1980 and 2 iterations for 1970.

The results of this effort appear in Table 3. By comparing the last two columns on page 4 of Table 2 and Table 3 it can be seen that the squaring of the matrix does result in a "smoothing" of the discrepancies between the Census and BEA data. If, as assumed, both the original Census and BEA data are partially in error and the "truth" lies somewhere in between them, this technique should improve the values that appear in the 24 x 30 matrix on pages 1-3.

---

*The 24 rows are each of the "place of work" jurisdictions (23 counties and Baltimore City) excluding the regional and other totals and the 30 columns are each of the place of residence jurisdictions (23 counties, Baltimore City, and 6 neighboring states).

**Net commutation as defined in Tables 3A and 3B is the converse of the definition used elsewhere in this report. As a result, what appears as negative net commutation or a negative net commutation rate is shown as a positive number in Section five of this report and vice versa. The difference is purely semantic.

INTRODUCTION

This volume presents projections of economic activity and population for the Nation and the States. A second volume, which presents projections for Metropolitan Statistical Areas, will be published in late 1985.

Projections are presented for population in three age groups, personal income classified by major income component, and employment and earnings (wages and salaries, other labor income, and proprietors' income) for 57 industrial groups. Projections are presented for 1990, 1995, 2000, 2005, 2015, and 2035; historical data are presented for 1969, 1973, 1978, and 1983.

The two-volume report is a major output of BEA's ongoing program of economic measurement, analysis, and projection. The projections program originated in 1964 under a cooperative agreement with the Water Resources Council. Upon enactment of the Water Resources Planning Act of 1965, the projections program became an integral part of the comprehensive water resources planning program and of the periodic national assessments of water and related land resources. The number of users of the projections has steadily increased to include additional Federal agencies, State and local agencies, and a variety of private organizations.

Fifteen years ago, the projections program acquired the acronym "OBERS," reflecting a cooperative effort between the Office of Business Economics (now BEA) and the Economic Research Service in the Department of Agriculture. Although the regional projections now are prepared solely by BEA, the OBERS name is retained for continuity.

The objectives of the OBERS program are the development and maintenance of (1) a set of both mid-term (5-year) and long-term (50-year) regional projections of economic activity and population, (2) analytical systems for the generation of the projections, and (3) analytical systems for special applications of the projections. As new data become available and as economic measures and projection methodologies are improved, BEA produces revised projections at periodic intervals.

The OBERS projections are prepared by what is commonly referred to as a "step-down" approach. Briefly, step-down approaches to analytical problems are based on the premise that data for larger aggregates are generally more accurate than the same type of information for more detailed classifications. Thus, in the OBERS program, national projections are developed first, and these are then distributed among the States to arrive at State-level projections. Similarly, in developing the national economic projections, aggregate gross national product (GNP) is projected first, and this total then is distributed among industrial groups.

The GNP projections are the basis for the derivation of other national measures, including total personal income and both employment and earnings by industry. The national projections of earnings and employment are distributed to the States on an industry-by-industry basis, according to the historical record of each State's contribution to these national totals. For each State, the nonearnings components of total personal income are projected to be consistent with projected total earnings, and then are added to total earnings to yield projected total personal income.

This volume focuses on the procedures used to make the projections for the Nation and the States. Following a discussion of the procedure for making the national projections, a second section discusses the procedure for making State projections of employment, earnings, population, and total personal income to 2005. The final section discusses the procedure for making projections beyond 2005.

STATE PROJECTIONS PROCEDURE TO 2005

State-level projections were prepared for employment and earnings by industry, population, and the nonearnings components of personal income. Total personal income was projected as the sum of its projected components. The projections were developed in four major steps. First, employment by industry was projected. Second, earnings by industry—consistent with the projections of employment by industry—were projected. Third, population—consistent with projected total employment—was projected. Fourth, the nonearnings components of personal income—consistent with the earnings and population projections—were projected and added to earnings to yield total personal income.

Each step of the State projections procedure has two phases. In the first phase, preliminary projections were generated based on mathematical relationships among variables. In the second phase, the preliminary projections were reviewed by the projections staff. Where appropriate, the projections were modified to remove anomalies and to account for new economic trends and events, which are not easily reflected in mathematical relationships. The projections were made final only after evaluations of the projections were provided by State government agencies that participated in the Federal-State Cooperative Program for Population Projections (FSCPPP).

Employment

In the first phase of the employment step, preliminary projections of State employment by industry were generated based on a mathematical model of economic growth. In the second phase, the preliminary projections were reviewed and modified according to general criteria (discussed later) that have characterized the OBERS program. The projections were made final after the FSCPPP review.

Preliminary projections

Preliminary State-level employment projections were made with a mathematical model of economic growth. In each State, growth of employment in each industry was projected based on (1) projected growth of total employment in the industry nationally (discussed earlier) and (2) projections of the ratio of total employment in the industry in the State to the employment required to meet intrastate demand for the industry's products. The ratio is assumed to reflect the State's competitive position in the industry; if the ratio exceeds (is less than) unity, the State is assumed to have a competitive advantage (disadvantage) in the industry, relative to other States.

Estimation of the ratios requires extensive data on interindustry patterns of sales and purchases in each State. Because State-level information defining interindustry relationships generally is unavailable, national relationships—based on unpublished BLS input-output data—were used to estimate the ratios for each industry in each State, 1969–83. Growth rates of the ratios then were estimated using ordinary least-squares regression techniques. The resulting growth rates, somewhat dampened, were used to project the ratios to 2005. Projections of national employment by industry and national input-output relationships, along with the projected ratios, then were used to project employment by industry in each State, 1984–2005. The projections generated by the mathematical model were reviewed and when appropriate, corrected within the basic-service framework described below.

Final projections

In each State, the preliminary projections of each industry's employment were evaluated and, as appropriate, modified according to one of two sets of criteria, depending on whether the industry was classified as "basic" or "service." This section introduces the concepts of basic- and service-industry groups and discusses the criteria used for each group. The classification of the 57 industries in the OBERS program as "basic" or "service" is then discussed.

Concepts and criteria.—Basic industries are those that produce products that are generally exportable. Because of the potentially broad market for such products, it was assumed that each State competes for a share of the national market of each basic industry. Accordingly, in each State, the preliminary projections of employment in each basic industry were evaluated according to the historical trend in the State's share of employment in that industry nationally. Preliminary projections of basic-industry employment were modified, if necessary, to reflect the assumption that the factors affecting the

State's employment share in the past (for example, relative wage rates, access to inputs and markets, etc.) will continue to affect it in the future, but less strongly, so that in all cases the rate of change in employment share slows. In other words, each State's share of each basic industry is assumed to move at a decelerating rate of change toward a long-term equilibrium. This assumption ensures that no industry in a State will have an unreasonably large or small share of national employment in the industry at the end of the projection period. Historically, factors, such as resource depletion and the long-term mobility of the factors of production, have generated self-limiting forces, which have tended to erode the advantages apparent in States with industry shares that are growing rapidly in the short term. Such equilibrating forces preclude an industry in any one State from growing or declining at a high rate for extended periods of time. The projected shares also were modified to take account of economic developments not yet reflected in the historical data and to incorporate comments and additional information provided by State agencies.

Service industries are those that produce products that, in general, satisfy only local demand. It was assumed that, in each State, employment in each service industry is determined by the level of local demand, which, in turn, depends on the overall size of the economic base. Thus, in each State, service-industry employment is determined by the share of the national market accounted for by the basic industries in total. In the evaluation process. the preliminary projections of employment in each service industry were tied to basic-industry employment by means of the service-industry location quotient, that is, the ratio of a service industry's share of State total employment to that industry's share of national total employment. Service-industry location quotients based on the preliminary projections were modified, if necessary, to ensure that historical trends for each industry were properly reflected. In most cases, the result was convergence toward unity; convergence is consistent with the assumption that, in the long term, the service components of State economies will become more similar to one another. In cases where a location quotient was diverging from unity historically, the historical trend generally was dampened or reversed in the final projection. In no case was a service-industry location quotient projected to change from a value more than unity to a value substantially less than unity, or vice versa.

During the review, modified State-level projections of service-industry location quotients and basic-industry shares of employment in the corresponding industries nationally, as well as national totals for all industries, were used in equations (1) to (5) below, to yield modified projections of total employment for each State. In the equations, E denotes the absolute level of employment, S denotes the share of national employment, the first subscript refers to industry, the second subscript refers to State, the superscript refers to year, and a subscript replaced by a dot (.) refers to a summation across that subscript.

With S^t_{ik}—the share of national employment in an industry that is accounted for by that industry in a State—projected for each basic industry, E^t_{ik}—employment in a State—for each basic industry can be expressed as:

$$E^t_{ik} = S^t_{ik} E^t_{i.} \tag{1}$$

Total State employment—the sum of basic- and service-industry employment—can be expressed as:

$$E^t_{.k} = \sum_{i=\text{basics}} E^t_{ik} + \sum_{i=\text{services}} E^t_{ik} \tag{2}$$

The first term on the right of equation (2)—total basic-industry employment in a State—can be obtained directly from the results of equation (1). The second term—total service-industry employment in a State—can be obtained indirectly, by using the definition of the location quotient (LQ)—the ratio of a service industry's share of State total employment to that industry's share of national total employment—to derive:

$$E^t_{ik} = LQ^t_{ik}\left(\frac{E^t_{i.}}{E^t_{..}}\right) E^t_{.k} \tag{3}$$

Denoting total basic-industry employment as $B^t_{.k}$ and incorporating equation (3) into equation (2) yields:

$$E^t_{.k} = B^t_{.k} + E^t_{.k} \sum_{i=\text{services}} LQ^t_{ik}\left(\frac{E^t_{i.}}{E^t_{..}}\right) \tag{4}$$

The sum in equation (4) can be obtained by using the projected national levels and the projected values of LQ^t_{ik}. Denoting the sum on the right of equation (4) as $M^t_{.k}$, the solution of equation (4) for $E^t_{.k}$ yields:

$$E^t_{.k} = \frac{1}{\left(1 - M^t_{.k}\right)} B^t_{.k} \tag{5}$$

Employment for individual service industries can be computed directly from equation (3), based on the solution from equation (5) for the State's total employment.

Industrial classification.—In each State, it was necessary to classify each of the 57 industries for which projections were prepared (see appendix) as either basic or service. As noted above, basic industries are assumed to depend on national demand, and service industries, on local—that is, State—demand. However, each basic industry in a State is to some extent, both a market for output of, and a source of inputs for, other industries in the State; thus, basic industries are seldom oriented exclusively toward the national economy. Similarly, the output of service industries is not necessarily consumed only by local residents and businesses. In short, there is a local element in most basic industries and a potential, if not actual, export element in most service industries. Because it was not feasible to classify each industry as part basic and part service, a State-specific basic/service dichotomy of the 57 industries was made by means of the two-step process discussed below.

In the first step, the industries were separated into three groups: (1) those classified as basic industries in all States; (2) those classified as service industries in all States; and (3) those classified as service industries in most States and potentially basic in a few States. No industries were classified as basic in most States and potentially service in others. In the second step, the third group was examined on a State-by-State basis to identify those States where a potentially basic industry should be classified as basic and, hence, projected as a share of the Nation (rather than by projecting its location quotient, as was done for service industries).

Except for construction, mining other than metals and fuels, food processing, and printing and publishing, all commodity-producing industries could be viewed as independent of the rest of the State's economic base, and so were classified as basic industries in all States. The railroad, pipeline, and water transportation industries were classified as basic in all States, because they provide interregional services that are responsive to demands external to the local economy. The Federal military and "other" industrial groups were classified as basic in all States because both are unrelated to local demand.[3]

Only construction, private households, and State and local government were classified as service industries in all States. This classification reflects the assumption that State-to-State variations in the relative level of economic activity for each of these industries reflect variations in local demand and not a net import/export component.

Potentially basic industries—service-type industries that might have large export components in some States—were analyzed, for classification purposes, in terms of historical location quotients. To be classified as basic, a potentially basic industry should have a location quotient substantially greater than unity (the "normal" level for a service industry). The analysis of location quotients proceeded as follows. For each potentially basic industry, historical location quotients for all States were arrayed from largest to smallest, and a "cutoff" level was specified. When the 1983 value of the industry's location quotient in a State exceeded the cutoff level, it was assumed that the industry had a large export component in that State, and so the industry was classified as basic in that State. In all States where the location quotients were below the cutoff level, the industry was classified as a service industry.

Population

In each State, resident population was projected for three major age groups: labor pool (ages 15 to 64), prelabor pool (ages 0 to 14), and postlabor pool (ages 65 and over). Projected employment directly determined the projected labor pool population and, indirectly, the projected population for the other two age groups.

The total labor pool population was projected as follows. First, the historical trend in the labor pool population/employment ratio in the State, relative to the corresponding ratio for the Nation, was projected. Second, this measure was multiplied by the labor pool population/employment ratio for the Nation—already projected—to derive the projected labor pool population/employment ratio for the State. Third, this product was multiplied by State employment—already projected—to yield the projected labor pool population in the State.

The prelabor pool population was projected as follows. First, the historical trend in the ratio of prelabor pool to labor pool population in the State, relative to the corresponding ratio for the Nation, was projected. Second, this measure was multiplied by the ratio of prelabor pool to labor pool population for the Nation—already projected—to derive the projected ratio of prelabor pool to labor pool population for the State. Third, this product was multiplied by State labor pool population—already projected—to yield the projected prelabor pool population in the State.

Postlabor pool population was projected in a similar fashion. In each State, the historical trend in the ratio of population aged 65 and over to population aged 0 to 64, relative to the corresponding ratio for the Nation, was projected. This measure was multiplied by the national ratio of population aged 65 and over to population aged 0 to 64—already projected—to derive the corresponding projected State ratio. The State ratio was then multiplied by State population aged 0 to 64—already projected—to yield projected State population aged 65 and over.

---

[3] Employment in the "other" group consists of U.S. residents employed by international organizations.

United States

1985

INTRODUCTION

This volume—the second of a two-volume set—presents projections of economic activity and population for the Nation and metropolitan areas (MA's). The first volume, which was published in mid-1985, presents projections for the Nation and States.[1]

The county compositions of the MA's are those defined by the Office of Management and Budget as of May 1985. The MA's—defined in appendix A—include Metropolitan Statistical Areas (MSA's); Consolidated Metropolitan Statistical Areas (CMSA's), which are large, complex areas that consist of two or more Primary Metropolitan Statistical Areas (PMSA's); and New England County Metropolitan Areas (NECMA's).

This volume presents projections for MA's for total population, total personal income, and employment and earnings (wages and salaries, other labor income, and proprietors' income) for 14 industrial groups. Projections are presented for 1990, 1995, 2000, 2005, 2015, and 2035; historical data are presented for 1969, 1973, 1978, and 1983.

The two-volume report is a major output of BEA's ongoing program of economic measurement, analysis, and projection. The projections program originated in 1964 under a cooperative agreement with the Water Resources Council. Upon enactment of the Water Resources Planning Act of 1965, the projections program became an integral part of the comprehensive water resources planning program and of the periodic national assessments of water and related land resources. The number of users of the projections has steadily increased to include additional Federal agencies, State and local agencies, and a variety of private organizations.

Fifteen years ago, the projections program acquired the acronym "OBERS," reflecting a cooperative effort between the Office of Business Economics (now BEA) and the Economic Research Service in the Department of Agriculture. Although the regional projections now are prepared solely by BEA, the OBERS name is retained for continuity.

The objectives of the OBERS program are the development and maintenance of (1) a set of both mid-term (5-year) and long-term (50-year) regional projections of economic activity and population, (2) analytical systems for the generation of the projections, and (3) analytical systems for special applications of the projections. As new data become available, and as economic measures and projection methodologies are improved, BEA produces revised projections at periodic intervals.

The OBERS projections are prepared by what is commonly referred to as a "step-down" approach. Briefly, step-down approaches to analytical problems are based on the premise that estimates for larger aggregates are generally more accurate than the same type of information for more detailed classifications. Thus, in the OBERS program, national projections are developed first; these then are distributed among the States to arrive at State-level projections; and the State-level projections then are distributed among MA's in each State.

This volume focuses on the procedure used to make the projections for MA's. A detailed discussion of the procedures for making the national and State projections is presented in volume 1.

---

[1] Volume 1—*1985 OBERS, BEA Regional Projections, State Projections to 2035*—is available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. The stock number is 003-010-00157-7. The price is $4.75.

METROPOLITAN AREA PROJECTIONS PROCEDURE

For the MA projections, national projections were developed first and these were then distributed among the States, according to the historical record of each State's contribution to the national totals. For each State, projections were then distributed among (1) the MA's that are completely within the State, (2) the parts of multi-State MA's that are within the State, and (3) the nonmetropolitan part of the State. Projections for multi-State MA's are sums of projections for individual State parts of these MA's.

Like the State projections procedure, each step of the MA projections procedure has two phases. In the first phase, preliminary projections were generated based on a mathematical model. In the second phase, the preliminary projections were reviewed and, when necessary, were modified to account for metropolitan area economic trends and events that are not easily reflected in mathematical relationships.

Civilian Employment

For MA's, employment (as well as earnings) was projected for 14 industries. Historical employment estimates were used to compute MA shares of State employment in each industry. An estimate of the historical average annual growth rate in the MA's share of State employment in each industry was made as follows:

(1) The MA shares of State employment in 1969 and 1973 were averaged,

(2) The MA shares of State employment in 1979 and 1983 were averaged, and

(3) The ratio of the second average to the first average was used to estimate an historical average annual growth rate in MA shares.

Preliminary projections

Preliminary projections of the MA share of projected State employment in each industry were based on dampened extensions of the historical average annual growth rate in the MA share. The average annual growth rate for 1983–85 was projected to equal 90 percent of the historical average annual growth rate; the average annual growth rate for 1985–90 was projected to equal 80 percent of the 1983–85 average annual growth rate; and the average annual growth rate for each succeeding 5-year period was projected to equal 80 percent of the rate for the preceding 5-year period. The projected reduction of the average annual growth rate of the shares assumes that self-limiting forces will tend to preclude an MA share from either growing or declining at a high rate for extended periods of time. Resulting projections of MA shares were multiplied by State employment by industry—already projected—to get preliminary MA employment projections by industry.

Final projections

For each industry in each MA, the preliminary projections of employment were evaluated using annual MA data for 1969–83 and more recent information. The preliminary projections were modified, when necessary, to take into account (1) unusually rapid growth or decline, (2) a permanent event, such as a factory shutdown, that primarily affected the level, rather than the trend, of economic activity, (3) a temporary event, such as a strike, that affected neither the projected level nor trend of economic activity, or (4) a planned event, such as an opening of a facility after 1983, that was not yet reflected in the historical employment estimates. After the modifications, the resulting MA shares of State employment by industry for each projected year were constrained to sum to 100 percent. Then, these constrained shares were multiplied by State employment by industry—already projected—to get final MA employment projections by industry.

Military Employment

As in the State projections, military employment was projected to remain at the 1983 level in all MA's except those in which growth in the station strength at military bases either is firmly planned, but not yet established, or is partially established, but not yet fully operational.

FOOTNOTES

L Less than $50,000 in earnings; fewer than 50 jobs in employment.

D Deleted to avoid disclosure of confidential information; data are included in totals.

1. Historical data for 1969 and 1973 are classified according to the 1967 Standard Industrial Classification (SIC) definitions; data for all other years are classified according to the 1972 SIC definitions.

2. Consists of wage and salary disbursements, other labor income, and proprietors' income.

3. Personal contributions for social insurance are implicitly included in the estimates of earnings, but they are not included in personal income and, therefore, are subtracted from earnings in the computation of personal income.

4. Consists of wages and salaries paid to, or employment of, U.S. residents working for international organizations.

5. Ordnance was reclassified in the 1972 SIC codes to other major industry groups: They are fabricated metal products; electric and electronic equipment; transportation equipment, except motor vehicles, and instruments and related products.

6. Available estimates of State-level population by age for the years prior to 1980 are not compatible with the results of the 1980 Census.

7. Because the ratio is a composite of place-of-work employment to place-of-residence population, contrasts from State to State will reflect the extent of commuting to work between States. For example, the District of Columbia has more employment than total population resulting from the large, in-commuting work force.

NOTE.—Detail may not add to totals because of rounding.

Appendix C

INDUSTRY DEFINITIONS

Earnings and employment are projected for 57 industries for the States. The industries are categorized according to the 1972 Standard Industrial Classification (SIC), and they reflect approximately the 2-digit industrial detail within this classification. The only industry that is not classified in the SIC is "other," which includes wages and salaries paid to U.S. residents employed by international organizations. Earnings and employment are projected for 14 industries for metropolitan areas (MA's).

For the OBERS program, government enterprise activity is not classified with any of the industries in the private sector. For example, printing and publishing (SIC 27) does not include the U.S. Government Printing Office. All general government and government enterprises are classified as either Federal civilian or State and local government. A separate Federal military classification is also included.

The following table provides a list of the industries projected.

[1] Historical data through 1974 are classified according to the 1967 SIC definitions, subsequent historical data and projections are classified according to the 1972 SIC definitions.

[2] Refers to United States residents employed by international organizations.

[3] The ordnance classification was discontinued in the 1972 SIC definitions. Earnings and employment previously included in ordnance are now included in one or more of the following classes: fabricated metal products (SIC 34), electric and electronic equipment (SIC 36), transportation equipment, except motor vehicles (SIC 37, except 371), and instruments and related products (SIC 38).

The following are brief industry definitions, based on the 1972 SIC manual.

SIC 01. Agricultural production—crops

This major group includes establishments (farms, orchards, greenhouses, and nurseries) primarily engaged in the production of crops or plants, vines, and trees (excluding forestry operations). This major group also includes establishments primarily engaged in the operation of sod farms, mushroom cellars, and cranberry bogs, and in the production of bulbs, flower seeds, and vegetable seeds.

SIC 02. Agricultural production—livestock

This major group includes establishments (farms, ranches, dairies, feedlots, egg production facilities, broiler facilities, poultry hatcheries, and apiaries) primarily engaged in the keeping, grazing, or feeding of livestock for the sale of livestock or livestock products (including serums), for livestock increase, or for value increase.

SIC 07. Agricultural services

This major group includes establishments primarily engaged in performing soil preparation services, crop services, veterinary services, other animal services, farm labor and management services, and landscape and horticultural services, for others on a fee or contract basis.

SIC 08. Forestry

This major group includes establishments primarily engaged in the operation of timber tracts, tree farms, forest nurseries, and related activities, such as reforestation services and the gathering of gums, barks, balsam needles, maple sap, Spanish moss, and other forest products.

SIC 09. Fishing, hunting, and trapping

This major group includes establishments primarily engaged in commercial fishing (including crabbing, lobstering, clamming, oystering, and the gathering of sponges and seaweed), the operation of fish hatcheries and fish and game preserves, commercial hunting and trapping, and game propagation.

SIC 10. Metal mining

This major group includes establishments primarily engaged in mining, developing mines, or exploring for metallic minerals (ores).

SIC 11. Anthracite mining

This major group includes establishments primarily engaged in producing anthracite (hard coal). Included are mining operations, dredging operations, and preparation plants (also known as cleaning plants, breakers, and washeries) whether or not such plants are operated in conjunction with the mines served.

SIC 12. Bituminous coal and lignite mining

This major group includes establishments primarily engaged in producing bituminous coal or lignite. Included are mining operations and preparation plants (also known as cleaning plants and washeries) whether or not such plants are operated in conjunction with the mines served.

SIC 13. Oil and gas extraction

This major group includes establishments primarily engaged in: (1) producing crude petroleum and natural gas; (2) recovering oil from oil sands and oil shale; and (3) producing natural gasoline and cycle condensate. Types of activities included are exploration, drilling, oil and gas well operation and maintenance, the operation of natural gasoline and cycle plants, and the mining and extraction of oil from oil sands and oil shale. This major group also includes basic activities customarily done at the field site, such as emulsion breaking and the desilting of crude petroleum in the preparation of oil and gas.

SIC 14. Mining and quarrying of nonmetallic minerals, except fuels

This major group includes establishments primarily engaged in mining or quarrying, developing mines, or exploring for nonmetallic minerals, except fuels. Also included are certain well and brine operations and primary preparation plants, such as those engaged in crushing, grinding, washing, or other concentration.

SIC 15-17. Construction

This major group includes establishments primarily engaged in construction. The term "construction" includes new work, additions, alterations, and repairs. Three broad types of construction activity are covered: (1) building construction by general contractors; (2) other construction by general contractors, and (3) construction by special trade contractors.

SIC 20. Food and kindred products

This major group includes establishments manufacturing or processing foods and beverages for human consumption and certain related products, such as manufactured ice, chewing gum, vegetable and animal fats and oils, and prepared feeds for animals and fowls.

SIC 21. Tobacco manufactures

This major group includes establishments engaged in manufacturing cigarettes, cigars, smoking and chewing tobacco, and snuff, and in stemming and redrying tobacco.

SIC 22. Textile mill products

This major group includes establishments engaged in performing any of the following operations: (1) preparing fiber and subsequently manufacturing yarn, thread, braids, twine, and cordage; (2) manufacturing broad woven fabric, narrow woven fabric, knit fabric, and carpets and rugs from yarn; (3) dyeing and finishing fiber, yarn, fabric, and knit apparel; (4) coating, waterproofing, or otherwise treating fabric; (5) the integrated manufacturing of knit apparel and other finished articles from yarn; and (6) manufacturing felt goods, lace goods, nonwoven fabrics, and miscellaneous textiles.

SIC 23. Apparel and other finished products made from fabrics and similar materials

This major group, known as the cutting-up and needle trades, includes establishments producing clothing and fabricating products by cutting and sewing purchased woven or knit textile fabrics and related materials, such as leather, rubberized fabrics, plastics, and furs.

SIC 24. Lumber and wood products, except furniture

This major group includes logging camps engaged in cutting timber and pulpwood; merchant sawmills, lath mills, shingle mills, cooperage stock mills, planing mills, and plywood mills and veneer mills engaged in producing lumber and wood basic materials; and establishments engaged in manufacturing finished articles made entirely or mainly of wood or wood substitutes.

SIC 25. Furniture and fixtures

This major group includes establishments engaged in manufacturing household, office, public building, and restaurant furniture, and office and store fixtures.

SIC 26. Paper and allied products

This major group includes the manufacture of pulps from wood and other cellulose fibers and from rags; the manufacture of paper and paperboard; and the manufacture of paper and paperboard into converted products, such as paper coated off the paper machine, paper bags, paper boxes, and envelopes.

SIC 27. Printing, publishing, and allied industries

This major group includes establishments engaged in printing by one or more of the common processes, such as letterpress, lithography, gravure, or screen, and those establishments that perform services for the printing trade, such as bookbinding, typesetting, engraving, photoengraving, and electrotyping. This major group also includes establishments engaged in publishing newspapers, books, and periodicals, regardless of whether or not they do their own printing.

SIC 28. Chemicals and allied products

This major group includes establishments producing basic chemicals and establishments manufacturing products by predominantly chemical processes. Establishments classified in this major group manufacture three general classes of products: (1) basic chemicals, such as acids, alkalies, salts, and organic chemicals; (2) chemical products to be used in further manufacture, such as synthetic fibers, plastics materials, dry colors, and pigments; and (3) finished chemical products to be used for ultimate consumption, such as drugs, cosmetics, and soaps; or to be used as materials or supplies in other industries, such as paints, fertilizers, and explosives.

SIC 29. Petroleum refining and related industries

This major group includes establishments primarily engaged in petroleum refining, manufacturing paving and roofing materials, and compounding lubricating oils and greases from purchased materials.

SIC 30. Rubber and miscellaneous plastics products

This major group includes establishments manufacturing rubber products (from natural, synthetic, or reclaimed rubber, gutta percha, balata, or gutta siak), such as tires, rubber footwear, mechanical rubber goods, heels and soles, flooring, and rubber sundries. This group also includes establishments engaged in molding primary plastics for the trade, and manufacturing miscellaneous finished plastics products.

SIC 31. Leather and leather products

This major group includes establishments engaged in tanning, currying, and finishing hides and skins, and establishments manufacturing finished leather and artificial leather products and some similar products made of other materials. Leather converters are also included.

SIC 32. Stone, clay, glass, and concrete products

This major group includes establishments engaged in manufacturing flat glass and other glass products, cement, structural clay products, pottery, concrete and gypsum products, cut stone, abrasive and asbestos products, etc., from materials taken principally from the earth in the form of stone, clay, and sand.

SIC 33. Primary metal industries

This major group includes establishments engaged in smelting and refining of ferrous and nonferrous metals from ore, pig, or scrap; rolling, drawing, and alloying ferrous and nonferrous metals; manufacturing castings and other basic products of ferrous and nonferrous metals; and manufacturing nails, spikes, and insulated wire and cable. This major group also includes the production of coke.

SIC 34. Fabricated metal products, except machinery and transportation equipment

This major group includes establishments engaged in fabricating ferrous and nonferrous metal products, such as metal cans, tinware, hand tools, cutlery, general hardware, nonelectric heating apparatus, fabricated structural metal products, metal forgings, metal stampings, ordnance (except vehicles and guided missiles), and a variety of metal and wire products not elsewhere classified.

SIC 35. Machinery, except electrical

This major group includes establishments engaged in manufacturing machinery and equipment other than electrical equipment (major group 36) and transportation equipment (major group 37). Machines powered by built-in or detachable motors ordinarily are included in this major group, with the exception of electrical household appliances (major group 36). Portable tools, both electric and pneumatic powered, are included in this major group, but hand tools are classified in major group 34.

SIC 36. Electrical and electronic machinery, equipment, and supplies

This major group includes establishments engaged in manufacturing machinery, apparatus, and supplies for the generation, storage, transmission, transformation, and utilization of electrical energy. The manufacture of household appliances is included in this group, but industrial machinery and equipment powered by built-in or detachable electric motors is classified in major group 35.

SIC 37. Transportation equipment

This major group includes establishments engaged in manufacturing equipment for transportation of passengers and cargo by land, air, and water. Important products produced by establishments classified in this major group include motor vehicles, aircraft, guided missiles and space vehicles, ships, boats, railroad equipment, and miscellaneous transportation equipment, such as motorcycles, bicycles, and snowmobiles.

SIC 38. Measuring, analyzing, and controlling instruments; photographic, medical, and optical goods; and watches and clocks

This major group includes establishments engaged in manufacturing instruments (including professional and scientific) for measuring, testing, analyzing, and controlling, and their associated sensors and accessories; optical instruments and lenses; surveying and drafting instruments, surgical, medical, and dental instruments, equipment, and supplies; ophthalmic goods; photographic equipment and supplies, and watches and clocks.

SIC 39. Miscellaneous manufacturing industries

This major group includes establishments primarily engaged in manufacturing products not classified in any other manufacturing major group. Industries in this group fall into the following categories: jewelry, silverware, and plated ware; musical instruments; toys and sporting and athletic goods; pens, pencils, and other office and artists' materials, buttons, costume novelties, and miscellaneous notions; brooms and brushes, caskets, and other miscellaneous manufacturing industries.

SIC 40. Railroad transportation

This major group includes establishments furnishing transportation by line-haul railroad and REA Express, and establishments furnishing switching and terminal services. Railways serving a single municipality, contiguous municipalities, or a municipality and its suburban areas are classified in major group 41.

SIC 41. Local and suburban transit and interurban highway passenger transportation

This major group includes establishments primarily engaged in furnishing local and suburban passenger transportation, such as those providing passenger transportation within a single municipality, contiguous municipalities, or a municipality and its suburban areas by bus, rail, or subway, either separately or in combination, and establishments engaged in furnishing transportation to local scenic features. Also included are establishments furnishing highway passenger terminal or maintenance facilities. Intercity bus lines are included in this major group, but interurban railways are classified in major group 40.

SIC 42. Motor freight transportation and warehousing

This major group includes establishments furnishing local or long-distance trucking or transfer services, and those engaged in the storage of farm products, furniture and other household goods, and commercial goods of any nature. The operation of terminal facilities for handling freight, with or without maintenance facilities, is also included.

SIC 44. Water transportation

This major group includes establishments engaged in freight and passenger transportation on the open seas or inland waters, and establishments furnishing such incidental services as lighterage, towing, and canal operation. This major group also includes excursion boats, sightseeing boats, and water taxis.

SIC 45. Transportation by air

This major group includes establishments engaged in furnishing domestic and foreign transportation by air and those operating airports and flying fields and furnishing terminal services.

SIC 46. Pipelines, except natural gas

This major group includes establishments primarily engaged in the pipeline transportation of petroleum and other commodities, except natural gas, which is included in major group 49.

SIC 47. Transportation services

This major group includes establishments furnishing services incidental to transportation, such as forwarding and packing services, and the arrangement of passenger and freight transportation.

SIC 48. Communication

This major group includes establishments furnishing point-to-point communication services by wire or radio, radio and television broadcasting, and services for the exchange or recording of messages.

SIC 49. Electric, gas, and sanitary services

This major group includes establishments engaged in the generation, transmission, and/or distribution of electricity, gas, and/or steam. Such establishments may include other types of service, such as transportation, communication, and refrigeration. Water and irrigation systems, and sanitary systems engaged in the collection and disposal of garbage, sewage, and other wastes by means of destroying or processing materials, are also included.

SIC 50. Wholesale trade—durable goods

This major group includes establishments primarily engaged in the wholesale distribution of durable goods.

SIC 51. Wholesale trade—nondurable goods

This major group includes establishments primarily engaged in the wholesale distribution of nondurable goods.

SIC 52-59. Retail trade

This division includes dealers in building materials, hardware, garden supplies, and mobile homes; general merchandise stores; food stores; automotive dealers and gasoline service stations; apparel and accessory stores; furniture, home furnishings, and equipment stores; eating and drinking places; and miscellaneous retail stores selling goods for personal consumption and rendering services incidental to the sale of the goods.

SIC 60. Banking

This major group includes institutions that are engaged in deposit banking or closely related functions, including fiduciary activities.

SIC 61. Credit agencies other than banks

This major group includes establishments engaged in extending credit in the form of loans but not engaged in deposit banking.

SIC 62. Security and commodity brokers, dealers, exchanges, and services

This major group includes exchanges, exchange clearinghouses, establishments engaged in the underwriting, purchase, sale, or brokerage of securities and other financial contracts on their own account or for the account of others, and other services allied with the exchange of securities and commodities.

SIC 63. Insurance

This major group includes insurance carriers of all types. Agents and brokers dealing in insurance and organizations rendering services to insurance carriers and policyholders are classified in major group 64.

SIC 64. Insurance agents, brokers, and service

This major group includes agents and brokers dealing in insurance and organizations offering services to insurance companies and policyholders.

SIC 65. Real estate

This major group includes real estate operators, and owners and lessors of real property, as well as buyers, sellers, developers, agents, and brokers. Establishments primarily engaged in the construction of buildings for sale (operative builders) are classified in industry 1531.

SIC 66. Combination of real estate, insurance, loans, law offices

This major group includes establishments not classifiable on the basis of predominant nature of business, generally small in size, that are regularly engaged in any combination of real estate, insurance, loans, or the practice of law. However, if any one of these activities constitutes the principal business, the establishment should not be classified in this major group, but should be classified in the industry provided for that activity.

SIC 67. Holding and other investment offices

This major group includes investment trusts, investment companies, holding companies, and commodity trading companies.

SIC 70. Hotels, rooming houses, camps, and other lodging places

This major group includes commercial and institutional establishments engaged in furnishing lodging, or lodging and meals, and camping space and camping facilities, on a fee basis.

SIC 72. Personal services

This major group includes establishments primarily engaged in providing services generally involving the care of the person or his apparel, such as laundries, dry cleaning plants, portrait photographic studios, and beauty and barber shops.

SIC 73. Business services

This major group includes establishments primarily engaged in rendering services, not elsewhere classified, to business establishments on a fee or contract basis, such as advertising; mailing services; building maintenance services; employment services; management and consulting services; protective services; equipment rental and leasing (except finance leasing); commercial research, development, and testing; photofinishing; and personnel supply services.

SIC 75. Automotive repair, services, and garages

This major group includes establishments primarily engaged in furnishing automotive repair, rental, leasing, and parking services to the general public.

SIC 76. Miscellaneous repair services

This major group includes establishments engaged in miscellaneous repair services.

SIC 78. Motion pictures

This major group includes establishments producing and distributing motion pictures, exhibiting motion pictures in commercially operated theaters, and furnishing services to the motion picture industry. The term "motion pictures" includes similar productions for television and other media using film, tape, or other means.

SIC 79. Amusement and recreation services, except motion pictures

This major group includes establishments engaged in providing amusement or entertainment on payment of a fee or admission charge, except motion pictures.

SIC 80. Health services

This major group includes establishments engaged in furnishing medical, surgical, and other health services to persons.

SIC 81. Legal services

This major group includes establishments engaged in offering legal advice or legal services, the head or heads of which are members of the bar.

SIC 82. Educational services

This major group includes establishments furnishing formal academic or technical courses, correspondence schools, commercial and trade schools, and libraries.

SIC 83. Social services

This major group includes establishments providing social and rehabilitation services to persons with social or personal problems requiring special services, and to the handicapped and the disadvantaged. Also included are organizations soliciting funds to be used directly for these and related services.

SIC 84. Museums, art galleries, and botanical and zoological gardens

This major group includes museums, art galleries, and botanical and zoological gardens that are not operated commercially. Receipts or funding of these establishments are not primarily from admission charges. These establishments are of historical, educational, or cultural interest.

SIC 86. Membership organizations

This major group includes organizations operating on a membership basis for the promotion of the interests of the members. Included are such groups as trade associations, professional membership organizations, labor unions and similar labor organizations, and political and religious organizations.

SIC 88. Private households

This major group includes private households that employ workers who serve on or about the premises in occupations usually considered as domestic service.

SIC 89. Miscellaneous services

This major group includes establishments engaged in performing services, not elsewhere classified, such as those rendered by engineers, architects, accountants, artists, lecturers, and writers. This major group also includes noncommercial establishments engaged primarily in educational, scientific, and research activities.

Government

This division includes all Federal, State, and local government activities, such as legislative, judicial, administrative, and regulatory functions, as well as government-owned and government-operated business enterprises.
